## Introduction

The purpose of the @OneStream BI Dashboard Design and Reference Guide is to provide clarification, tips, best practices, and configurations for all implementers, administrators, and end users.

The @OneStream BI Dashboard Design Guide is a collection of smaller guides and was created to enhance the @OneStream experience by providing in-depth explanations of specific functions, comprehensive reporting, and overall usage which can be applied to any application. It is an explanation of all properties, fields, and options found in OneStream. The Reference Guide is broken into four sub sections: Application, System, OnePlace, and Excel Add-in.

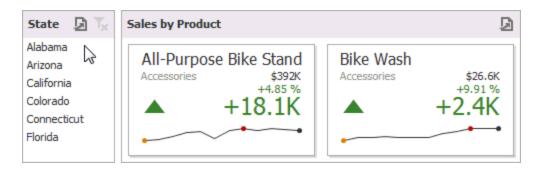

## **BI Dashboard Viewer**

The BI Dashboard Viewer provides the capability to display dashboards at runtime.

### **Master Filtering**

The dashboard allows you to use any data-aware dashboard item as a filter for the entire dashboard (Master Filter). You can select elements in a master filter item (chart bars, pie segments, grid records, etc.) to filter data in the rest of the dashboard by the selected values.

### **Master Filtering Modes**

The master filter item supports two selection modes:

**Multiple**: Allows you to select multiple elements in the master filter item. To clear the selection in the master filter item, use the **Clear Master Filter** button in the dashboard item's caption.

	- 51	-	-	
		5	1	-
	- 3	-	- 7	<u>e</u> .
-	_		-	1
			- 14	~ell

**Single**: Allows you to select only one element in the master filter item. When this mode is enabled, the default selection will be set to a master filter element. You can change this selection, but cannot clear it. To learn how to filter dashboard data via a specific dashboard item, refer to the documentation for this item in the Dashboard Items section.

### **Drill-Down**

Dashboard provides the drill-down feature, which allows you to change the detail level of data displayed in a dashboard item. This feature allows you to drill down to display the details, or drill up to view more general information.

To return to the previous detail level, use the **Drill Up** button in the dashboard item's caption, or the corresponding command in the context menu.

To learn how to drill down using a particular dashboard item, refer to the documentation for this item in the Dashboard Items topic.

### Dashboard Parameters Requesting Parameter Values

The Dashboard Viewer provides a built-in Dashboard Parameters dialog, which allows you to change dashboard parameter values. This dialog can be used to apply filtering to dashboard data.

Dashboard Parameters		$\times$
Parameter	Value	
From date	1/1/2015	-
To date	1/1/2016	
Reset Su	bmit Cance	el

To invoke the dashboard parameters, click the **Parameters** button in the dashboard title. Select the required parameter values and click the **Submit** button to apply the changes. To reset changes to the default values, click the **Reset** button.

## **BI Viewer Tabs**

The BI Viewer component is comprised of three main tabs: BI designer, component properties, and data adapters.

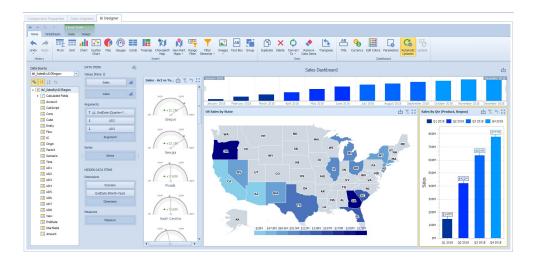

## **BI Designer**

Once the BI Designer is selected the user is presented with the controls that provides the capability to build a functional dashboard. The dashboard provides elements that display visual or textual information in a dashboard known as dashboard items. These Dashboard items can be divided into the following groups: data visualization items, filter elements and dashboard item containers. To visualize data within dashboard items, you need to first establish a connection to a data source as mentioned above. The data source collects the data adapter data and passes it to the dashboard.

The BI Designer layout provides an intuitive user interface that facilitates data binding and shaping, and layout design. Many of these normally complex tasks can be accomplished with a simple drag-and-drop operation, allowing you to start creating dashboards immediately. This BI Designer contains rich, intuitive graphics and tools that will assist in analyzing data with functionality that requires little to no coding. Users would be able to combine multiple views of data to get better insight to their information, perform ad hoc analyses and quickly publish their dashboard to share it within the application.

Features of this solution assist with Ad Hoc Reports, Dashboard Data Analysis, Data Visualization, Key Performance Indicators, Drill down, filter(s) and interact with OneStream data and other sources of data.

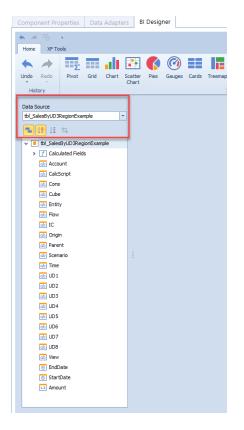

### **Data Source**

The Data Source section allows you to navigate through dashboard data provided from the Data Adapter. It displays the data source structure and allows you to bind dashboard items to the required data source fields using drag-and-drop functionality. The data source section also enables you to manage calculated fields.

The data source browser contains the following elements:

**Data Source Drop-Down List** Allows you to select the required data source and its required data member. The command buttons pictured below are available to sort or group fields in the browser.

The **Field List** displays data source fields. You can drag these fields to the data item placeholders to specify data binding. Data source data field types define the field type of each field.

### Data Items pane

The Data Items pane is placed side-by-side with the data source browser and allows you to create and modify data binding using drag-and-drop operations.

The data items pane can contains the following elements:

Data Item placeholder: Creates data binding using drag-and-drop operations.

**Data Item**: Identifies data binding by mapping to a specified data source field. Each data item has the Data Item menu button, used to invoke a menu that allows you to perform various data shaping operations.

Data Section: Corresponds to a specified dashboard item area or element.

**Data Item Container**: Provides data item sets (e.g., for calculating the difference between two measures). Data item containers have options buttons that allow you to change specific dashboard item settings.

Sort indicator: Shows the current sort order for the data item.

Coloring indicator: Indicates whether coloring by hue is enabled for the data item.

### **Component Properties**

The BI Designer has its own section for parameters. These parameters can be used to filter on and drive the data shown in BI viewer components (inbound parameter). There is also the ability for the BI viewer to pass values from the BI viewer components to other dashboard components (outbound parameters) outside of the BI viewer.

### **Parameter Name Value Pairs (Inbound Parameter)**

The **Parameter Name Value Pairs** property is used to assign a BI viewer parameter to some value. This value can be a bound parameter.

#### **BI Viewer Tabs**

### Action Name Value Pairs (Outbound Parameter)/ Bound Parameter

The BI Designer has its own section for parameters. These parameters can be used to filter the BI viewer and to pass values from the BI viewer components to other dashboard components (outbound parameters) outside of the BI viewer.

The **Action Name Value Pairs** property is used to assign a BI viewer parameter to some value. This value can be a bound parameter.

	reportion

Parameter	Name Valu	e Pairs (e.g., Param	1=Value1,	
Palette Col	ors			!pa
Action				
Bound Para	ameter			Acc

In the screenshot above, the Action Name Value Pairs property of Actual vs Budget=Account is used to assign that BI viewer value to a bound parameter which is assigned AccountNumber.

In the screenshot below, the grid component in the BI viewer is the source of the Action Name Value Pairs property that is being used to assign a BI viewer parameter to a bound parameter.

The name of the grid component is Actual vs Budget and this along with the column Account is the source of the Action Name Value Pairs property used in the example above. The result is that anytime an account (or multiple accounts -if setup) is selected at runtime, that selected account value(s) will be passed to the designated bound parameter (AccountNumber).

If the row that contains 52000 – Promotions is selected, the value of the account from that row will be assigned to the bound parameter.

Actual vs Budget				🖞 🛣 🎝 🗄

### **Data Adapters**

Data adapters specify the kind of data used within a dashboard. Once the data adapter is configured and pointing to the desired data, attach it to a dashboard component in order to display it on a dashboard.

The following topics will guide you through the process of creating a dashboard.

When you run an application containing the dashboard designer, it already contains an empty dashboard. To create a new dashboard, click the **New** button in the ribbon **Home** tab.

- 1. Go to Application tab and select Workspaces.
- 2. Select **Components** (in the Dashboard Maintenance Unit), then select **Create Dashboard Component.**
- 3. Select BI Viewer

lter		
BI Viewer		
Book Viewer		
Button		
Chart (Basic)		
Chart (Advanced)		
Check Box		
Combo Box		
Cube View		
Data Explorer		
Data Explorer Report		
Embedded Dashboard		

4. Enter a name: biv2\_SalesByRegionExample, description: SalesAnalysisByRegion and

#### select Save.

	Palette Colors			!pa	ram_MapChartColors!

### **Adding Dashboard Items**

To create a dashboard item in the dashboard designer, click the corresponding button in the **Home** ribbon tab.

This creates an empty dashboard item and displays the required data sections for binding this item to data (for instance, the image below displays the Pivot dashboard item and corresponding data sections).

	Pivot 1		西 5
Values		Grand Total	
Value	Grand Total		]
Columns			
Column			
Rows			
Row			
HIDDEN DATA ITEMS			
Dimensions			
Dimension			
Measures			
Measure			

Perform the following steps to design a dashboard item:

- Bind the dashboard item to data.
- Perform the required data shaping operations (such as grouping, sorting and filtering). Use the interactivity features to enable interaction between various dashboard items.
- Adjust the dashboard item's position and size and specify the dashboard item caption settings.
- Specify specific dashboard item settings based on its type. To learn more, see Designing Dashboard Items

After you have created and designed the dashboard item, you can create an exact copy. To do this, click the Duplicate button in the Home ribbon tab, or use the dashboard item's context menu. To remove the dashboard item from the dashboard, use the delete button or the corresponding item in the context menu.

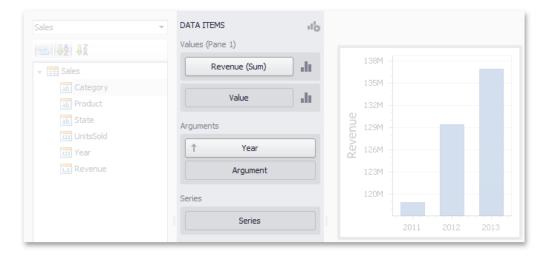

### **Binding Dashboard Items to Data**

This topic explains how to bind the newly created dashboard item to data source fields, to display data.

### **Binding Concepts**

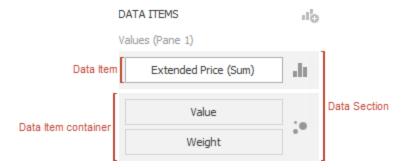

To bind dashboard items to data in the dashboard designer, the Data Items pane is used.

Each dashboard item type has a specific set of data sections, such as values, arguments and series in the chart, columns and sparklines in the grid, and values, columns and rows in the pivot grid. Each data section corresponds to a particular dashboard item area or element and should be mapped to data to be displayed within this area/ element.

Mapping is performed using data items - objects that are used to bind a dashboard item to data source fields. Data items are used to link the dashboard item to the required data source fields and, thus, visualize data within the dashboard item.

Another key concept in data binding is the data item container, which represents a set of data items. It can contain either a single data item or multiple data items, and allows you to specify various options related to how a specific dashboard item visualizes data.

The data item can process data in two ways - as dimensions or measures. This depends on the data section to which the data item is assigned, and the type of the data item container.

These values can be of any type - string, date-time or numeric. In any case, the dashboard does not summarize the dimension values, but groups identical values. You can perform grouping, sorting, or display the top values for the dimension values. You can also customize data format settings for numeric and date-time values. To access the data shaping settings, use the data item's menu button.

1 Category	Data Item menu button
------------	-----------------------

For instance, dimensions are used to provide data for the chart argument axis, pivot grid column and row headers.

These values can be of any type - numeric, date-time or string. In any case, the dashboard will calculate an appropriate summary function against measure values. You can also customize the data format settings that affect how summary values are displayed. To access these settings, use the data item's menu button.

For example, measures are used to provide data for the chart's Y-axis, and to calculate pivot cell values.

Specific data sections display options buttons for each data item container. Use these buttons to invoke a dialog that allows you to specify the settings of this data item container. These settings affect how a particular dashboard item's area/element displays the provided data.

### **Data Source Browser**

The Data Source Browser allows you to navigate through dashboard data sources. It displays the data source structure and allows you to bind dashboard items to the required data source fields using drag-and-drop operations. The Data Source Browser also enables you to manage calculated fields.

Со	mponent Pro	perties	Data	Adapt	ers B	l Desig	ner		
+	. 🔺 🖑	Ŧ							
H	Home XF To	ols							
		Σ		alt	••		Ø		
U	Indo Redo	Pivot	Grid	Chart	Scatter Chart	Pies	Gauges	Cards	Treemap
	History								1
	Data Source tbl_SalesByUD3	-	mple		•				
		sByUD3Reg		ple					
		ulated Field	s						
	ab Acco								
	ab Calcs								
	ab Cons								
	ab Cube								
	ab Entit	у							

The Data Source Browser contains the following elements:

- Data Source Drop-Down List: Allows you to select the required data source
- Query/Data Member Drop-Down List: allows you to select the required query or data member.

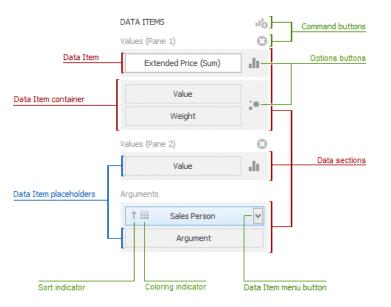

• **Field List**: Displays data source fields. You can drag these fields to the data item placeholders to specify data binding.

The data source browser identifies the following data field types:

lcon	Description	
<b>V</b>	Boolean	
101	Byte	
0	Date-time	
123 1,2	Numeric	
ab	String	
f	Calculated Field	

### **Data Items Pane**

The data items pane is placed side-by-side with the data source browser and allows you to create and modify data binding using drag-and-drop operations.

The data items pane can contain the following elements:

- Data Item Placeholder: Used to create a data binding using drag-and-drop operations
- **Data Item**: Identifies a data binding by mapping to a particular data source field. Each data item has the Data Item menu button, used to invoke a menu that allows you to perform various data shaping operations.
- Data Section: Corresponds to a dashboard item area or element
- **Data Item Container**: Used to provide data item sets (e.g., for calculating the difference between two measures). Data item containers have Options buttons that allow you to change specific dashboard item settings (e.g., to switch between chart series types or grid column types).
- Sort Indicator: Shows the current sort order for the data item
- Coloring Indicator: Indicates whether coloring by hue is enabled for the data item

Specific dashboard items have command buttons that allow you to perform various operations, for instance, to add a new pane to the chart dashboard item.

### **Create Binding**

The data items pane displays data sections of the selected dashboard item. It can be used to add, rearrange or remove data items.

To bind a dashboard item to data, select the dashboard item. Then choose the required data field from the data source browser and drop it onto the appropriate section in the data items pane.

Sales 🔻	DATA ITEMS
	Values (Pane 1)
▼ III Sales	Revenue Value
ab Category	Arguments
ab Product	
ab State	Argument
123 UnitsSold	Series
123 Year	
1,2 Revenue	Series

You can remove the data item by dragging it outside the data items pane.

To learn how to bind a specific dashboard item to data, see the Providing Data topic for the required dashboard item.

To rename the data item, click its menu button and select **Rename**.

Revenue	•	Rename Data Item	
	Count ✓ Sum	New name	
	Format	Revenue	
	Rename		
	172,	ОК	Cancel

### **Modify Binding**

You can modify data binding by dragging data item containers within a data section. To do this, drag the data item container to the required position.

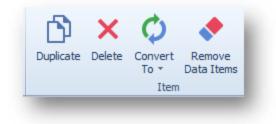

↓ State	L.	Sales by St	ate		<b>D</b> 7x			
+ State		State	Sales	Sales vs Ta	rget			
Sales (Sum)	7	Alabama	\$117M	+3.62	2 %		DATA ITEMS

You can also modify data binding by dragging data items within the data items pane. This action has the following specifics:

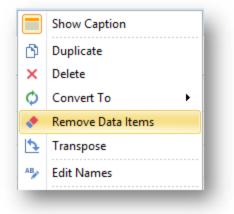

- If you drag the data item to a new position, the settings specified for the corresponding data item container will be restored to the default values.
- If you drag the data item to an existing data item placeholder, the settings of the corresponding data item container will be applied.

### **Clear Binding**

To remove all data items for a selected dashboard item, use the Remove Data Items button in the Home ribbon tab.

You can also do this via the dashboard item's context menu.

## Working with Data

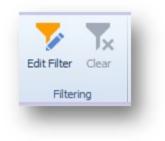

The topics in this section describe how to work with data in a connected data source. This section contains the following topics:

- Filter Queries
- Pass Query Parameters Stored Procedures Preview Data
- Creating Calculated Fields

### **Filter Editor**

Filtering can be applied to either underlying or aggregated data.

To filter data, click the **Edit Filter** button in the data ribbon tab, or right-click in dashboard item to bring up the filter editor dialog, which allows you to build filter criteria.

lter Editor		23
And 💿 😳 [UD3] Equals Florida] 🖍 🔇		
[UD3] = 'Florida'		-
	OK Cance	Apply

The filter tab allows you to filter underlying data, while the group filter tab provides the capability to filter data aggregated on the server side. In the Filter Editor, you can compare a field value with the following objects:

- A parameter value (represented by the 
  icon): Click this button to switch back to the initial mode ("static value") to compare the field value with a static value.

You can pass the query parameter to the filter string. To do this, click the  $\mathcal{P}$  button, then click the  $\equiv$  button and finally click <select a parameter>.

Elter Group Filter And  Carlos CategoryName] Equals Seelect a parameter  CategoryName] Equals Add Query Parameter	
Bind To	dashboardParameter1 dashboardParameter2 Add Dashboard Parameter
Select only 0 records starting with index 0	OK Cancel

In the popup menu, you can choose from the following options:

Add Query Parameter: Allows you to create a new query parameter. In the corresponding dialog, you can specify a parameter's name, type, and value. If the current query already contains query parameters, they will be displayed within the popup menu.

ê≣ 2↓		
Design		*
Name	Param	ieter1
Type	String	
Value	Bevera	ges
Value		

**Bind To**: Allows you to pass a dashboard parameter to a filter string. You can choose from the list of predefined dashboard parameters or create a new dashboard parameter by selecting Add Dashboard Parameter. If you selected Add Dashboard Parameter, the following dialog will be invoked.

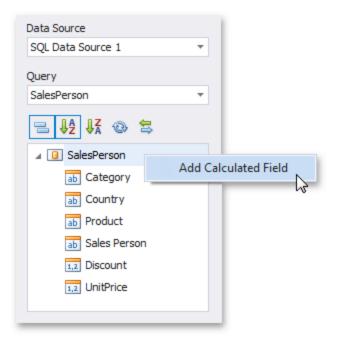

Da	Dashboard Parameter ×				
	∎≣ <b>2</b> ↓				
	Behavior		*		
	Allow Multiselect	No			
	Allow Null	No			
	Visible	Yes			
	Data		*

	Look-Up Settings	No Look-Up			
	Туре	String			
	Value				
	Design		*		
	Name	Parameter1			
	Name Gets of sets the parameter name.				
	OK Cancel				

### **Creating Calculated Fields**

The dashboard designer provides the capability to create calculated fields that allow you to apply complex expressions to data fields that are obtained from the dashboard's data source. You can use these fields in data visualizations as regular data source fields. After you have created a data source, you can add a new calculated field based on the existing data source fields.

To create a calculated field, select the required data source (and the required query/data member, if applicable) in the data source browser and click the **Add Calculated Field** button in the ribbon's data source tab, or right-click the field list and select Add Calculated Field in the context menu.

This prompts the expression editor dialog, which allows you to specify an expression that will be used to obtain calculated field values. Here, you can construct the required expression.

You can use the following elements in expressions:

- Functions
- Operators
- Columns
- Constants
- Parameters

After the expression has been specified, click OK. This displays a new calculated field in the data source structure. Now you can specify the required calculated field type.

#### **Creating Dashboards**

Expression Editor			x
[UnitPrice]*(1	-[Discount])		•
✓ Functions Aggregate DateTime Logical Math String Operators Columns Constants Parameters	Enter text to search	The type of this field is: Float	
		OK Cano	el

Data Source	
SQL Data Source 1	Ŧ

⊿ 📰 SalesPerson	
Galculated Fields	
1,2 Calculated Field 1	
ab Category	
ab Country	
ab Product	
ab Sales Person	
1,2 Discount	
1,2 UnitPrice	
	_

### **Editing a Calculated Field**

To edit a calculated field, use its context menu.

This menu contains the following items:

- Edit Expression: Prompts the expression editor dialog, which allows you to change an expression for an existing calculated field.
- Field Type: Specifies the type of the calculated field
- Rename: Changes the calculated field name
- Delete: Removes the existing calculated field from the data source

#### **Data Processing Errors**

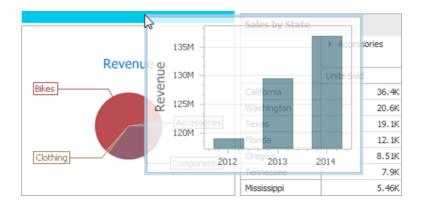

The Dashboard Designer provides the capability to display errors that occurred during data processing operations (such as changing measure summary types, calculation errors, etc.). For instance, the grid below shows an error when the summary type of the extended price measure is set to median in server mode.

The following errors of	cur during data binding:	
"Median is not support	ed for MSSQL in server mode."	
	Grid 1	Я
	Extended Price (Median)	-
	Extended Price (Median)	

To see the error message, hover the mouse pointer over the  $\triangle$  icon.

# **BI Dashboard Items Layout**

The BI Dashboard Designer provides the capability to arrange and resize dashboard items and groups in various ways, using simple drag-and-drop operations.

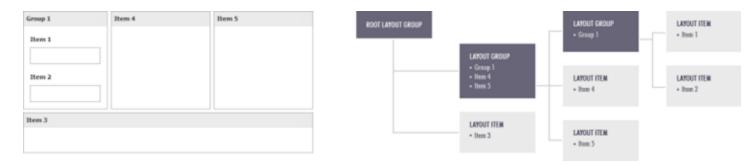

## **Layout Concepts**

The dashboard arranges dashboard items and groups using layout items and layout groups. They are special containers that are used to present a dashboard layout as a hierarchical structure.

- A layout item is used as a container that displays an individual dashboard item.
- A layout group is used as a container that is used to arrange layout items (or other layout groups) either horizontally or vertically. At the same time, layout groups are used as containers that display dashboard item groups.

Thus, a dashboard layout is hierarchically arranged from the root layout group to bottommost layout items, which display individual dashboard items.

### Dashboard Title

The Dashboard Title is located at the top of the Dashboard. The dashboard title can contain text or image content, elements selected in the master filter item and command buttons.

		Dashboa	ard Title text
	Dashboard Title ima	ge	Master Filter state Export To button
		🚯 Sales (	Overview Parameters butto
Sales by Sta	ite	Tx	Sales by Product Category
State	Sales	Sales vs Target	O Mar O Committee
Georgia	\$48.2M	+7.18 %	- Bikes 🔨 Components
Florida	\$137M	-4.13 % 🔻	
Connecticut	\$62.1M	+4.12 % 🔺	2M
Colorado	\$61.5M	+3.80 %	
California	\$104M	+2.29 %	1M
Arizona	\$80.4M	+7.36 %	OM
Alabama	\$41.8M	+3.04 %	01-Oct-12

When you hover over the filter icon, all master filters applied to the dashboard are displayed in the invoked popup.

The dashboard title can contain the following command buttons:

- **Export To** button (the D icon) allows you to print/export the dashboard. To learn more about printing and exporting, see the Printing and Exporting topic.
- Parameters button (the b icon) allows you to modify dashboard parameter values. To learn how to modify dashboard parameter values, see the Requesting Parameter Values topic.

### **Dashboard Item Caption**

Each dashboard item has a caption that is displayed at the top of this item. The caption contains static text along with other information, as well as command buttons.

The caption of the Dashboard item contains the following information and buttons, depending on the dashboard item type:

- Dashboard Item Name: Represents the static text within a dashboard item's caption
- Data Item Container Name: Represents the name of the data item container
- Drill-Down Value: Shows value(s) from the current drill-down hierarchy
- Export To Button: Allows you to print or export a dashboard item
- Values Button: Invokes a drop-down menu that allows you to switch between provided values (in the pie, card, gauge and map dashboard items)
- Clear Master Filter Button: Allows you to reset filtering when a dashboard item acts as the Master Filter
- **Drill Up Button**: Allows you to return to the previous detail level when the drill-down capability is enabled for this item

## **Inspect Data**

You can review your underlying data from your visualization in an aggregated or raw data view and create quick reports which can be exported to multiple formats.

1. Click **Inspect Data** from a Dashboard or from the BI Designer to open the Data Inspector window.

2. Click **Aggregated** to review the data that is retrieved from the dashboard item's data.

#### BI Dashboard Items Layout

UD3	Amount (Sum)	Target	: (Sum)

	200004 (100 and	~	

4. You can also right-click for the Inspect Data menu option.

		Sales Dashboard April 2018
January 2018	April 2018	April 2018 Inspect Data Maximize Clear Master Filter
US Sales by State	March 2018	Custom Period Print Preview
WA	MT	Export To PDF Export To Image Export To Excel
DI ID	1	Export Dashboard

### **Item Resizing**

You can resize individual items/groups of items by dragging their edges.

Item 1	Item 2
4	*

By default, a 2x2 layout group of dashboard items is horizontally oriented and contains two child layout groups. This arranges dashboard items in two 'columns' and allows you to set a different height for items in different columns. You can switch the orientation of the 2x2 group to Vertical using the indicator at the group intersection.

## **Item Positioning**

You can change the position of a dashboard item by using drag-and-drop and one of the following approaches:

- If the caption of the dashboard item is visible, click it and hold down the left mouse button while dragging the item.
- If the caption of the dashboard item is not visible, click the icon in the top left corner, and hold down the left mouse button while dragging the item.

# **Designing Dashboard Items**

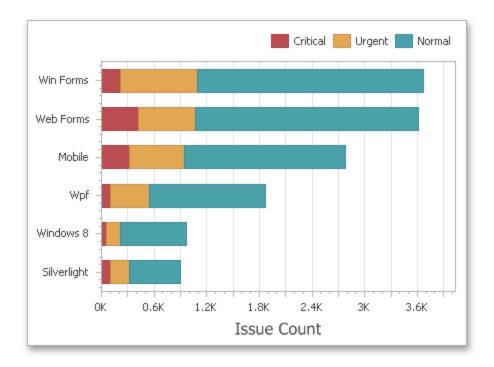

The BI Dashboard provides several visualization elements designed to present visual or textual information in a dashboard.

This section describes the available dashboard items:

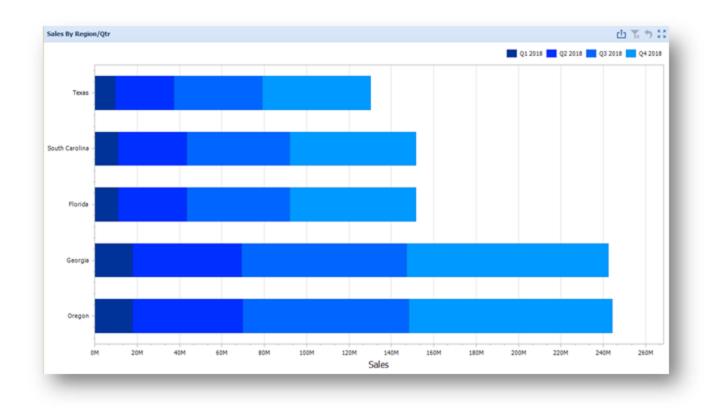

- <u>Chart</u>
- Scatter Chart
- <u>Grid</u>
- Pies
- <u>Cards</u>
- Gauges
- <u>Pivot</u>
- Choropleth Map
- Geo Point Maps
- Range Filter
- Images
- Text Box
- <u>Treemap</u>
- Filter Elements
- Dashboard Item Group

## Chart

The topics in this section describe the features available in the Chart dashboard item and provide extensive information on how to create and customize charts in the Dashboard Designer.

The Chart dashboard item presents data visually using different types of series.

A series represents a grouping of related data points. The most important characteristic of a series is its type, which determines a particular visual representation of data.

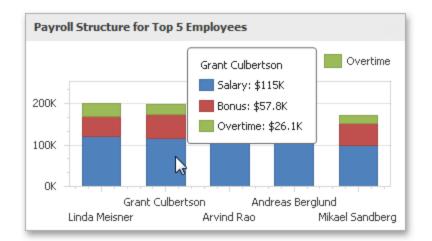

The Chart dashboard item includes the following series types:

- A **Bar** series displays data as sets of rectangular bars with lengths proportional to the values that they represent.
- Point and Line series display data as standalone points or points joined by a line.
- An **Area** series displays data by a line that joins points, and the shaded area between the line and the argument axis.

A **Range** series is the area between two simple series displayed as a shaded area, or bars that stretch from a point in one series to the corresponding point in another series.

A **Weighted** series displays data using a third dimension, expressed by a bubble's size.

• **Financial** series are useful in ananlyzing stock and bond prices as well as the behavior of commodities.

The Chart dashboard item can display a tooltip that shows information on a hovered series point.

### **Providing Data**

°.

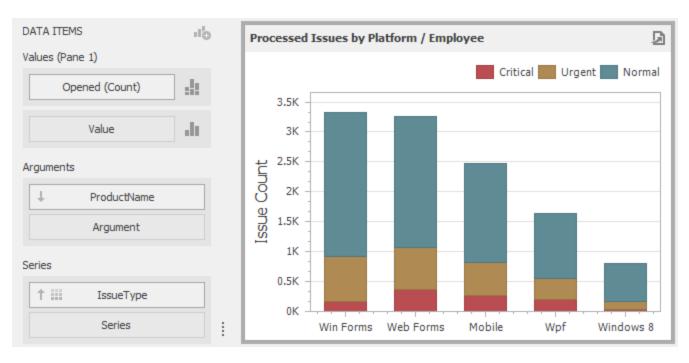

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner. To learn more, see the <u>Binding Dashboard Items to Data</u> topic.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Chart dashboard item to data in the Designer.

Binding to Data in the Designer Transposing Arguments and Series.

#### Binding to Data in the Designer

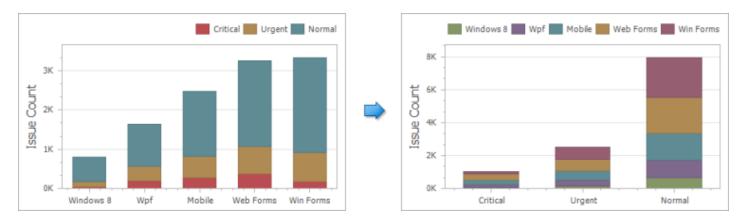

To bind the Chart dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. The table below lists and describes the Chart's data sections.

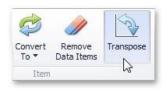

Section	Description
Values	Contains Data Items against which the Y-coordinates of data points are calculated. The Option s button next to the Value data item allows you to select the series type and specify different options. Note that some types of series accept several measures. To learn more, see the documentation for the required series type.
Arguments	Contains Data Items that provide values displayed along the X-axis of the chart.
Series	Contains Data Items whose values are used to create chart series.

### **Transposing Arguments and Series**

The Chart dashboard item provides the capability to transpose chart arguments and series. In this case, Data Items contained in the Arguments section are moved to the Series section, and vice versa.

To transpose the selected Chart dashboard item, use the Transpose button in the Home ribbon tab.

### Series

This section describes how to select a desired series type in the overview topic, and lists the variety of available series types.

#### **Series Overview**

The Chart dashboard item supports a variety of series types - from simple bar and line charts to complex candle stick and bubble graphs.

#### **Series Types**

To switch between series types in the Dashboard Designer, click the Options button next to the required data item (or placeholder) in the Values section. Filtering can be applied to either underlying or aggregated data.

Values (Pane 1)	
Revenue (Sum)	.lı
Value	5

In the invoked Series Options dialog, select the required series type and click OK

Series Options				
Series Type	Common Options	Point Label Option	IS	
Bar			<b>^</b>	
Point / Line				
***	XX	: J.	P	
Area				
Range				
	<u>^</u>		*	
		ОК	Cancel	

You can also do this using the Series Type gallery in the Design Ribbon tab.

Chart	Tools		
Data	Design		
Y-Axis Settings	Show Legend		
		Legend	Ы

#### **Series Options**

To manage common series options, use the Common Options tab of the Series Options dialog.

Series	Options			×
Se	ries Type	Common Options	Point Label Options	
	Ignore	secondary axis empty points oint markers		
			OK	Cancel

**Plot on secondary axis**: Specifies whether or not the secondary axis is used to plot the current series.

**Ignore empty points**: Specifies whether or not empty points are ignored when plotting the current series. Note that this option is in effect for the Line, Area, and Range Area series.

**Show point markers**: Specifies whether or not to show point markers for the current series. Note that point markers are always shown when Master Filtering is enabled for the Chart dashboard item.

#### **Series Point Labels**

The Point Label Options tab of the Series Options dialog allows you to enable series point labels and manage their settings.

Series Type Common	Options	Point Label Op	tions	
Show point labels:	$\checkmark$			
Content:	Value			Ŧ
Overlapping mode:	Hide ov	erlapping labels		•
Orientation:	Default	:		Ŧ
Bar options				
Show for zero values:				
Position:	Outside	2		-

Show point labels: Specifies whether or not to show point labels for the current series.

Content: Specifies the type of content displayed within point labels.

**Overlapping mode**: Specifies the label overlap mode. This option is not in effect when the dashbaord is displayed in the Web Viewer.

Orientation: Specifies the orientation of point labels.

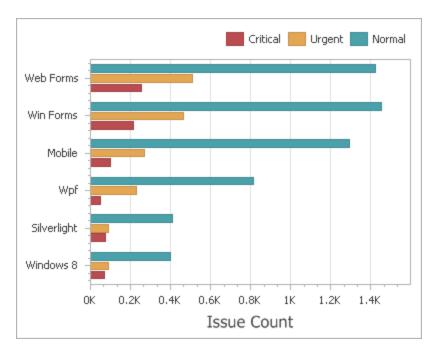

Bar options: These settings are in effect for Bar series only.

**Show for zero values**: Specifies whether or not to show labels for points with zero values. Position - Specifies the position of point labels relative to bars.

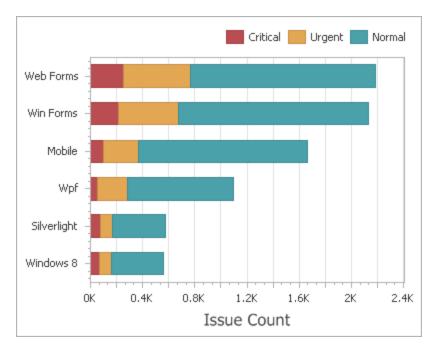

#### **Bar Series**

Bar series visualize data using rectangular bars with lengths proportional to the values that they represent.

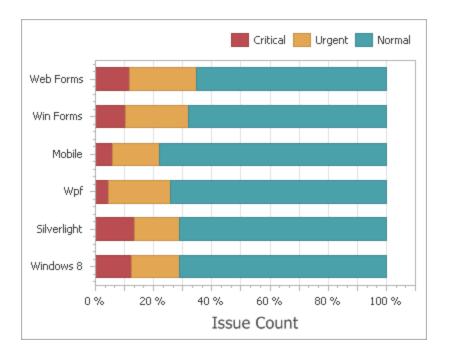

Bar series can be used to compare values across categories.

Stacked Bar series show the contribution of individual categories to the whole.

Full-Stacked Bar series allow you to compare the percentage that each value contributes to a total across categories.

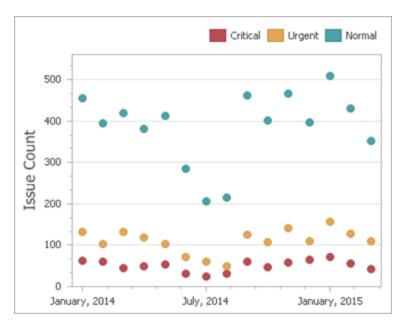

### **Point and Line Series**

Point series visualize data as a set of individual numeric data points. Line series are used to connect numeric data points by different types of line segments.

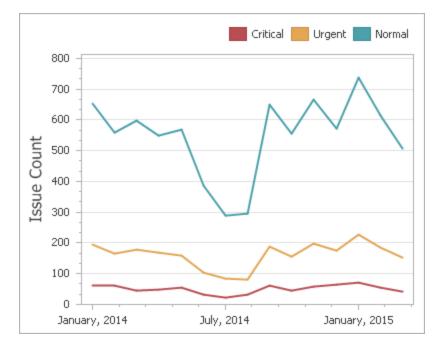

The following types of Point and Line series are available:

- Point Line
- Stacked Line
- Full-Stacked Line Step Line
- Spline

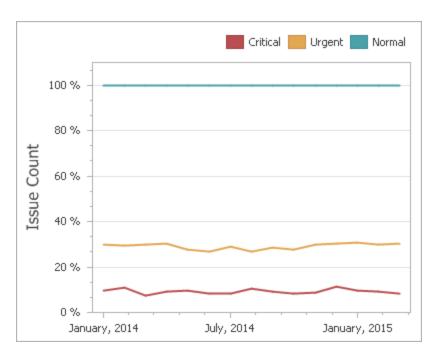

Point series visualize data as a set of individual numeric data points.

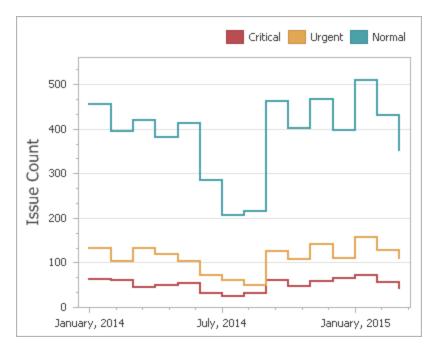

Line Series Connect numeric data points by straight line segments

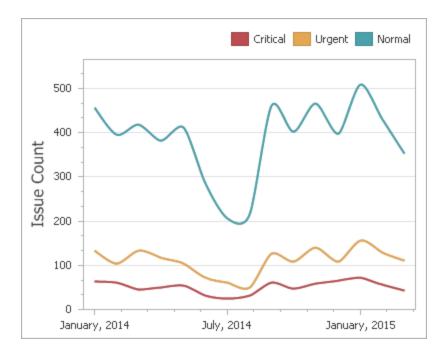

Stacked Line series are useful for showing the trend of the percentage for each value

Step Line series use vertical and horizontal lines to connect the numeric data points forming a step-like progression.

Spline series plot a fitted curve through each numeric data point.

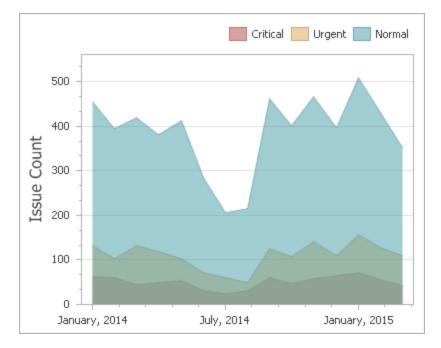

#### **Area Series**

Area series connect numeric data points by different types of line segments and fill the area between the line and X- axis/other series.

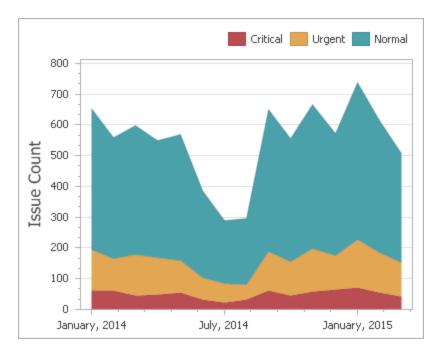

The following types of Point and Line series are available:

- Area
- Stacked Area
- Full-Stacked Area
- Step Area
- Spline
- Area Stacked
- Spline Area
- Full-Stacked Spline Area

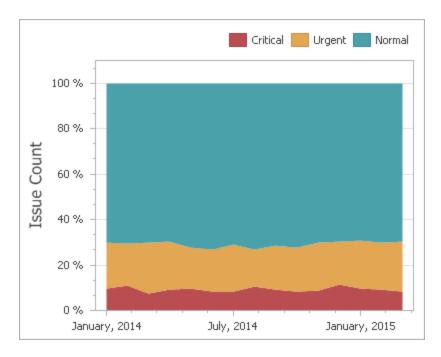

Area series connect numeric data points y straight line segments and fill the area between the line and X-axis.

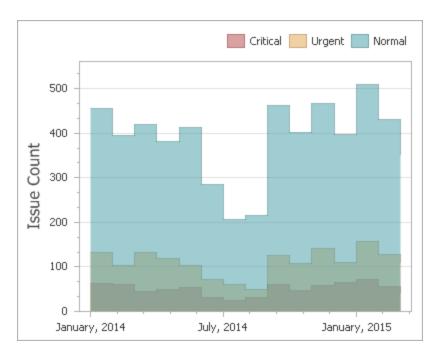

Stacked Area series can be used to show the trend of the contribution for each value. Stacked Area series connect numeric data points by straight line segments and fill the area between the line and previous series.

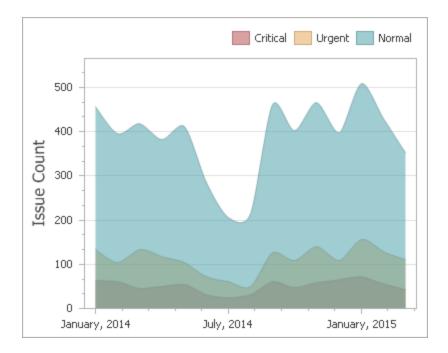

Full-Stacked Area series are useful to show the trend of the percentage for each value.

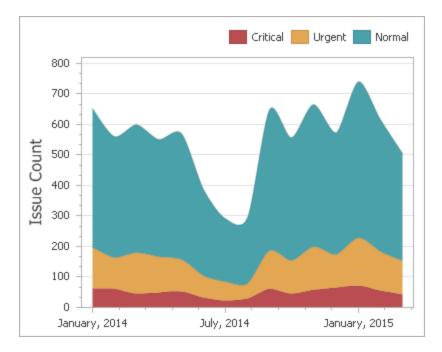

Step Area series use vertical and horizontal lines to connect the numeric data points forming a step-like progression and fill the area between the line and X-axis

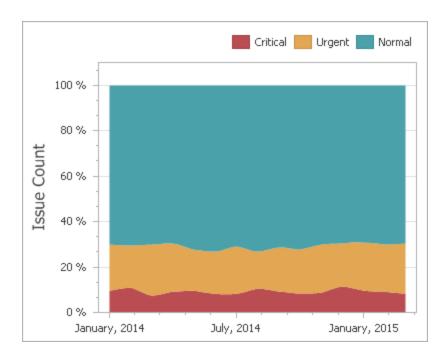

Spline Area series plot a fitted curve through each numeric data point and fill the area between the line and X-axis.

Stacked Area series can be used to show the trend of the contribution for each value. Stacked Area series plot a fitted curve through each numeric data point, and fill the area between the line and previous series.

Full-Stacked Spline Area series are useful to show the trend of the percentage for each value.

#### **Range Series**

Range series are generally used to show variations in a specified time range like temperature, price, etc. The following types of Range series are available:

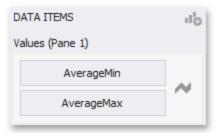

- Range Bar
- Range Area

A range series is a space between two simple series displayed as a filled area (Range Area) or bars that stretch from a point in one series to the corresponding point in the other (Range Bar). Thus, you need to provide two measures instead of one to display a range series.

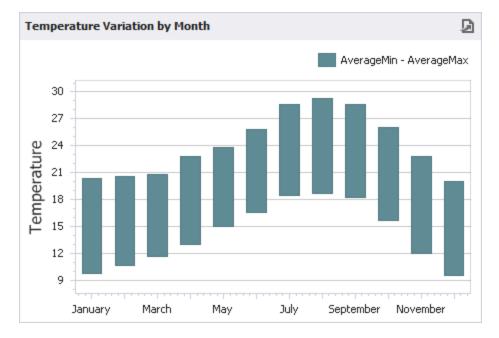

Value 1 - a measure against which the first set of values is calculated.

Value 2 - a measure against which the second set of values is calculated.

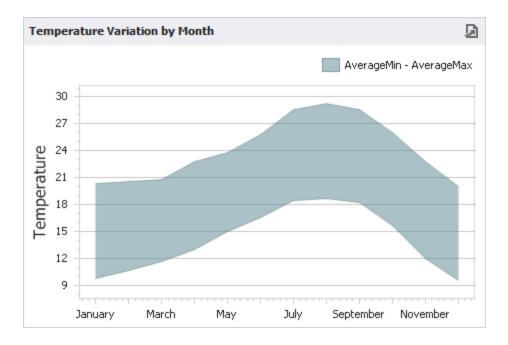

When you select the Range Bar or Range Area series type in the Designer, the Data Items area displays two data item placeholders. Drag and drop the required measures to corresponding placeholders.

Range Bar series are similar to Bar Series except that they are drawn between a range of values.

Range Area series are similar to Area Series except that their areas are filled between a range of values.

#### **Weighted Series**

Weighted series allow you to visualize data in three dimensions. The following types of Weighted series are available:

Bubble

Data points in a weighted series present the following two measures.

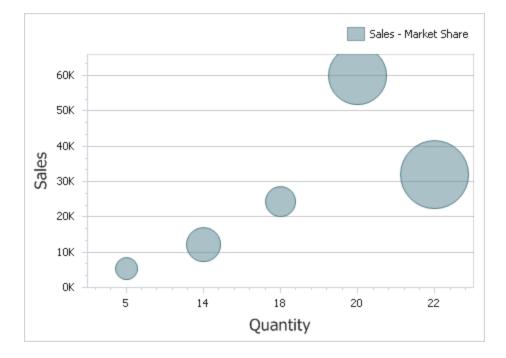

Value - the Y-coordinate of series points.

Weight - the size of series points.

When you select the Bubble series type in the Designer, the data items area displays two data item placeholders. Drag and drop the required measures to corresponding placeholders.

DATA ITEMS	10
Values (Pane 1)	
Sales	
Market Share	.

#### **Financial Series**

Financial series are used to illustrate stock prices. The following types of Financial series are available.

- High-Low -Close Stock
- Candle Stick

Note that financial series do not support a standard coloring mechanism used to color chart series points. The Chart dashboard item colors series points of financial series in the following way.

Black if the price at the end of the previous period is lower than the price at the end of the current period.

Red if the price at the end of the previous period is larger than the price at the end of the current period.

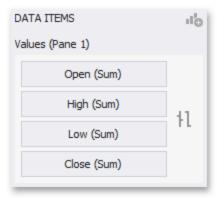

When you select the High-Low-Close series type in the Designer, the Data Itemsarea displays three data item placeholders. High-Low-Close series require three measures to be provided.

DATA ITEMS	10
Values (Pane 1)	
High (Sum)	
Low (Sum)	11
Close (Sum)	

- High: the maximum price within the specified period (the top of the series point).
- Low: the minimum price within the specified period (the bottom of the series point).
- **Close**: the price at the end of the specified period (the tick mark).

When you select the Stock series type in the Designer, the Data Items area displays four data item placeholders. Stock series require four measures to be provided.

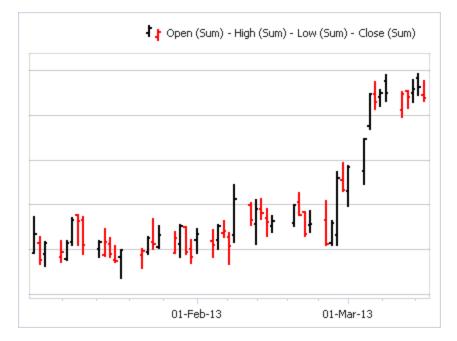

Open: the price at the beginning of the specified period (the left tick mark).

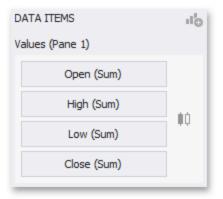

High: the maximum price within the specified period (the top of the series point).

Low : the minimum price within the specified period (the bottom of the series point).

**Close**: the price at the end of the specified period (the right tick mark).

When you select the Candle Stick series type in the Designer, the Data Items area displays four data item placeholders. Candle Stick series require four measures to be provided.

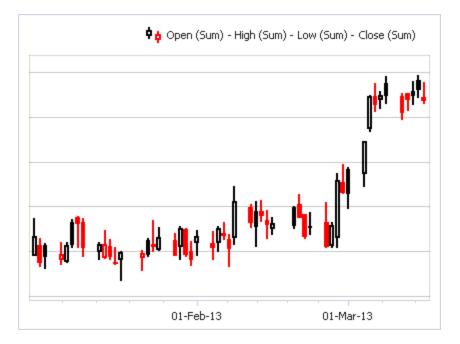

**Open**: the price at the beginning of the specified period.

High: the maximum price within the specified period (the upper shadow top).

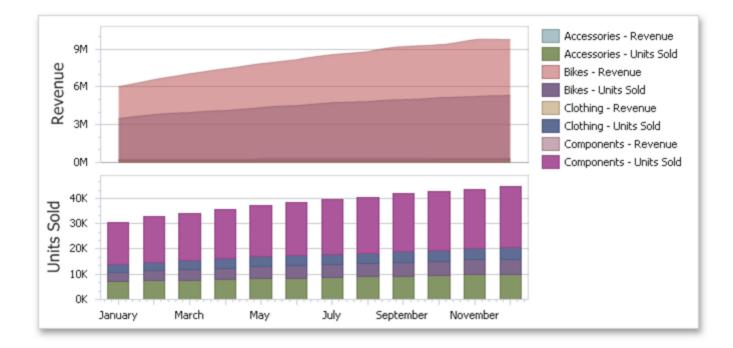

Low : the minimum price within the specified period (the lower shadow bottom).

**Close** : the price at the end of the specified period.

The Chart dashboard item can contain any number of panes. Panes are visual areas within a diagram that display chart series.

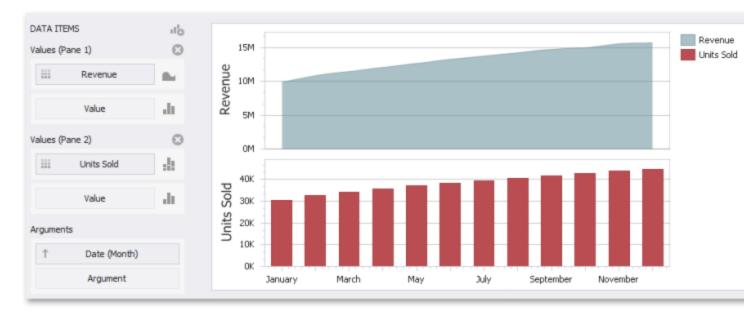

Each pane has its own Y-axis and displays a specific set of series. All panes in a chart share the same X-axis.

To add a pane click the **Add Pane** button (the <sup>1</sup>/<sub>0</sub> icon) at the top right of the Data Items pane.

DATA ITEMS Values (Pane 1)	<b>.</b> 2029
Revenue	•
Value	di i

Once a new pane is added, the Dashboard Designer creates another Values section in the Data Items pane.

Use this section to provide Data Items that supply values to be displayed in the new pane.

To remove a pane, click the Remove Pane button (the icon) displayed in the corresponding Values section.

### Interactivity

This section describes features that enable interaction between the Chart and other dashboard items. These features include Master Filtering and Drill-Down.

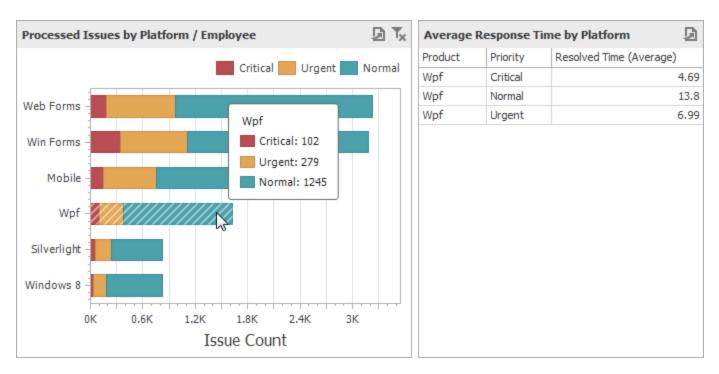

#### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

The Chart dashboard item supports filtering by argument, series or points.

#### **Filtering by Arguments**

When filtering by arguments is enabled, you can click series points to make other dashboard items only display data related to selected argument values.

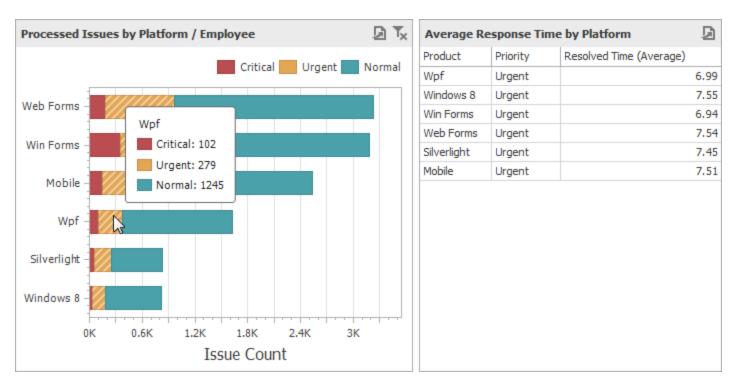

To enable filtering by arguments in the Designer, set the required Master Filter mode and click the

Arguments button in the Data Ribbon tab (or the 💷 button if you are using the toolbar menu).

#### **Filtering by Series**

When filtering by series is enabled, you can click a series point to make other dashboard items only display data related to the selected series.

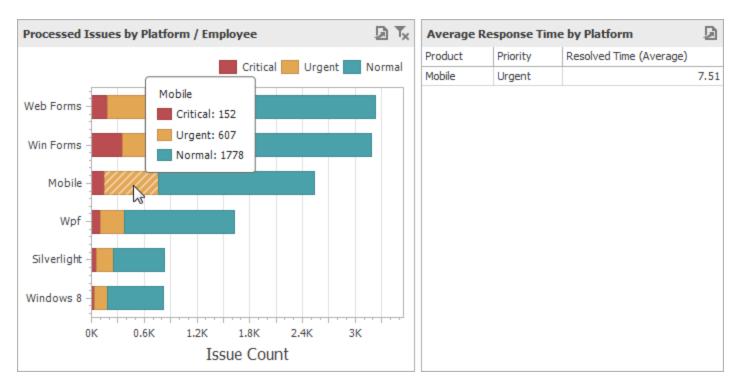

To enable filtering by series in the Designer, set the required Master Filter mode and click the

**Series** button in the Data Ribbon tab (or the **I** button if you are using the toolbar menu).

#### **Filtering by Points**

When filtering by points is enabled, you can click a individual point to make other dashboard items display only data related to the selected point.

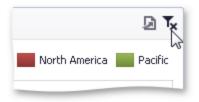

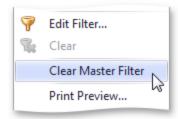

To enable filtering by points in the Designer, set the required Master Filter mode and click the **Points** button in the Data Ribbon tab.

#### **Reset Filtering**

To reset filtering, use the Clear Master Filter button in the chart's caption area or the corresponding command in the chart's context menu.

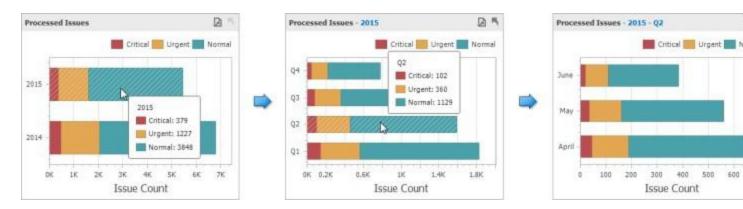

### **Drill-Down**

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly.

The Chart dashboard item supports drill down on argument or series values.

#### **Drill-Down on an Argument**

When drill down on arguments is enabled, you can click a series point to view a detail chart for the corresponding argument value.

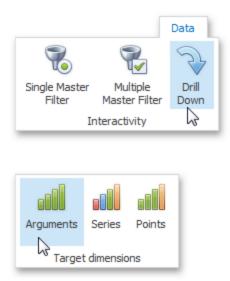

When Filtering by Arguments is enabled, you can view the details by double-clicking a series point.

Drill down on arguments requires that the Arguments section contains several Data Items, from the least detailed to the most detailed item.

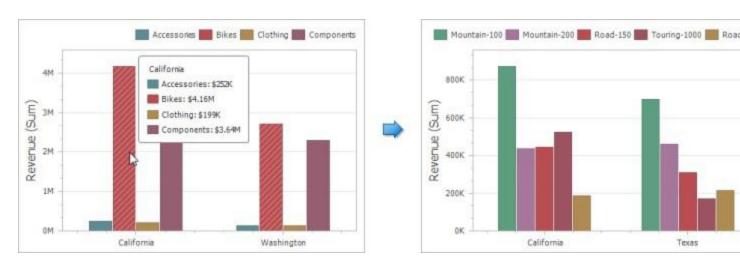

To enable drill down on arguments, click the Drill Down button in the Data Ribbon tab (or the  $\Im$ 

button if you are using the toolbar menu) and the Arguments button (or the **ull** button if you are using the toolbar menu).

#### **Drill-Down on a Series**

When drill down on a series is enabled, you can click a series point (or corresponding legend item) to view a detail chart for the corresponding series.

When Filtering by Series is enabled, you can view the details by double-clicking on a series point.

Drill down on a series requires that the Series section contains several Data Items, from the least detailed to the most detailed item.

Series		
	Category	
	Product	
	Series	

To enable drill down on a series, click the Drill Down button in the Data Ribbon tab (or the  $\Im$ 

button if you are using the toolbar menu) and the Series button (or the **ull** button if you are using the toolbar menu).

#### Drill-Up

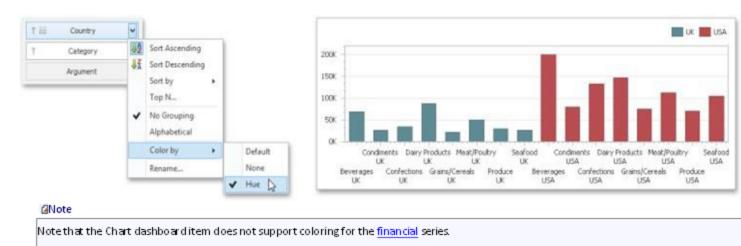

To return to the previous detail level (drill up), use the Drill Up button within the Chart caption or in the context menu.

### Coloring

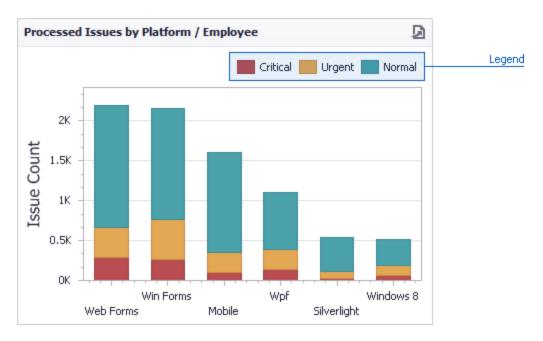

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

By default, the Chart dashboard item colors different measures and series dimensions by hue. In the example below, series points corresponding to different countries (UK and USA) are painted in different colors.

#### Legend

A legend is an element of a chart that identifies chart series and series points (for instance, colored points corresponding to argument values).

This topic describes how to customize various legend settings.

#### Visibility

You can specify whether or not a chart should display a legend.

Show Legend		- →
43	Legend	

In the Designer, use the Show Legend button in the Legend section of the Design Ribbon tab.

#### **Position and Orientation**

To specify the legend's position and orientation, select one of the predefined options from the gallery in the Design Ribbon tab,

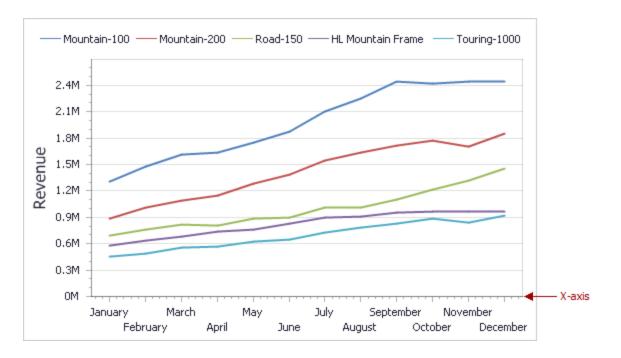

Inside Horizontal		^	
Inside Ve	rtical	5	

### Axes

The Chart dashboard item displays two axes by default: the X-axis and the Y-axis. The topics in this section describe how to customize axis settings.

#### X-Axis

The X-axis is the axis of arguments.

#### **General X-Axis Settings**

To access X-axis settings, use the X-Axis Settings button in the Diagram section of the Design Ribbon tab.

This will invoke the X-Axis Settings dialog.

X-Axis Settings	x
Reverse	
Show title	
O Default text	
Oustom text	Arguments
Enable zooming	
🗹 Limit visible points	10 🗘
	OK Cancel

This dialog contains the following settings:

**Reverse** Allows you to reverse the X-axis. If the X-axis is reversed, its values are ordered from right to left.

Show Xaxis Allows you to hide and show the X-axis.

**Show** Allows you to hide and show the X-axis title. You can choose whether to use the default text or specify a custom string.

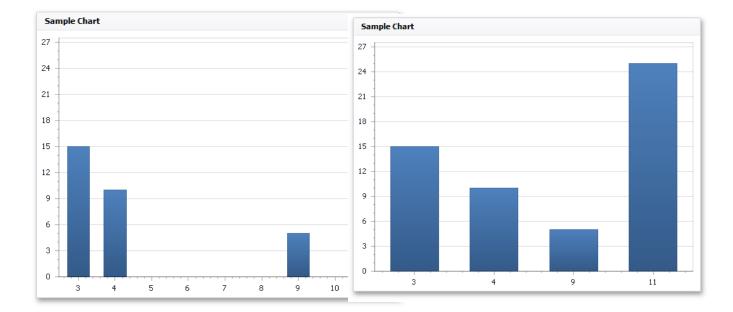

**Enable** Allows you to enable zooming for the X-axis. The X- axis' scroll bar provides the **zooming** capability to perform navigation in the zoomed diagram.

Limit Allows you to limit the number of points displayed on the chart's diagram along the Xvisible axis. The X-axis' scroll bar provides the capability to perform navigation if the number points of all points exceeds the number of visible points.

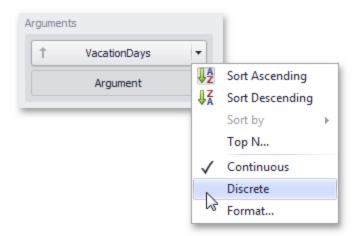

#### **Continuous and Discrete X-Axes**

If the dimension in the Arguments section contains numeric data, the Chart can create either a continuous X-axis or a discrete X-axis.

Continuous X-axis	Discrete X-axis
If a continuous axis is used, the distance between argument values is proportional to their values.	On a discrete axis, all argument values are an equal distance from each other.

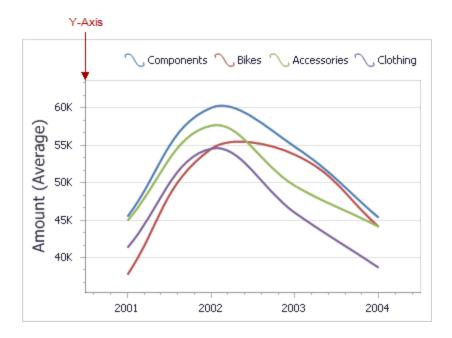

To specify the X-axis type in the Designer, invoke the data item menu for the argument dimension and select the axis type.

#### **Y-Axis**

The Y-axis is the numerical axis of values.

#### **General Settings**

To access the Y-axis settings, use the Y-Axis Settings button in the Diagram section of the Design Ribbon tab.

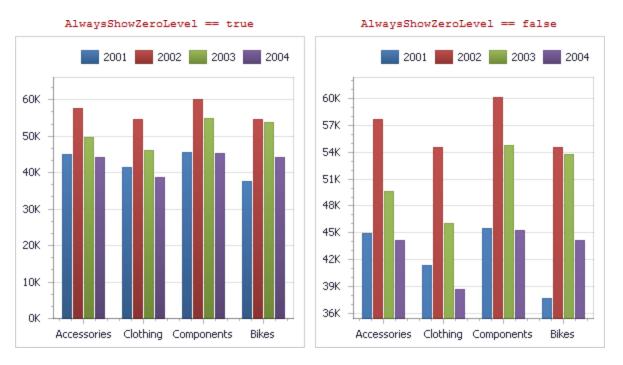

This will invoke the Y-Axis Settings dialog.

Y-Axis Settings	x
Pane 1	•
Always show zero level	
Reverse	
🗹 Show grid lines	
Show Y-axis	
🗹 Show title	
Oefault text	
Custom text	Sales
Logarithmic scale	10 -
	OK Cancel

Use the combo box at the top to select the pane for the Y-axis settings you need to edit. The dialog contains the following settings:

**Always show zero level**: Specifies whether or not the axis' zero level is visible. If this option is unchecked, the visible axis range is defined based on the values plotted in the chart.

**Reverse**: Allows you to reverse the X-axis. If the X-axis is reversed, its values are ordered from top to down.

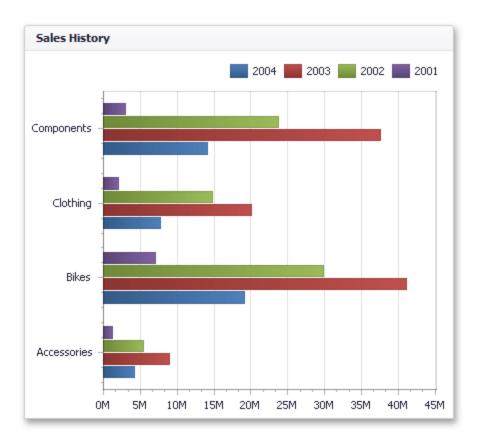

Show grid lines: Allows you to hide and show grid lines for the Y-axis.

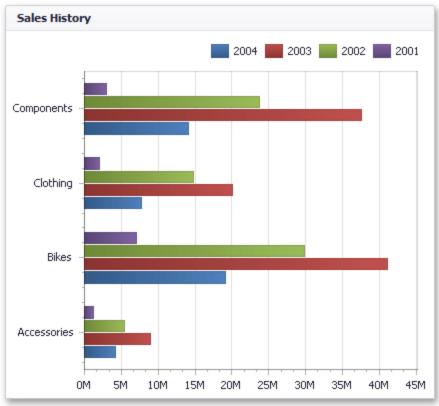

Show Y-axis: Allows you to hide and show the Y-axis.

**Show title**: Allows you to hide and show the Y-axis title. You can choose whether to use the default text or specify a custom string.

#### Orientation

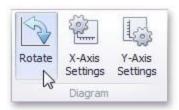

You can rotate the Chart so that the X-axis becomes vertical, and the Y-axis becomes horizontal.

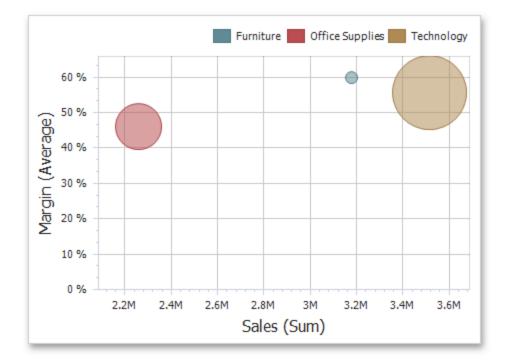

**BI Viewer Guide** 

To rotate a Chart in the Designer, use the Rotate button in the Diagram group of the Design Ribbon tab.

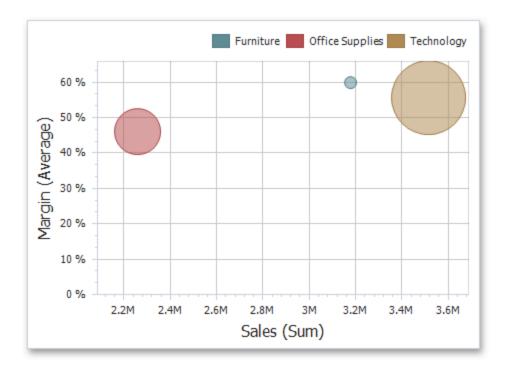

# **Scatter Chart**

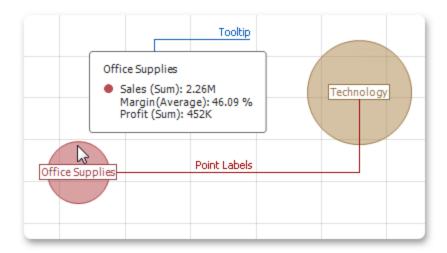

The topics in this section describe the features available in the Scatter Chart dashboard item, and provide information on how to create and customize scatter charts in the BI Dashboard.

The Scatter Chart dashboard item visualizes summaries using three dimensions: the X-axis, the Y-axis and the size of data points.

The Scatter Chart dashboard item can display point labels and tooltips that show information on data points. To see a tooltip, hover over the required point.

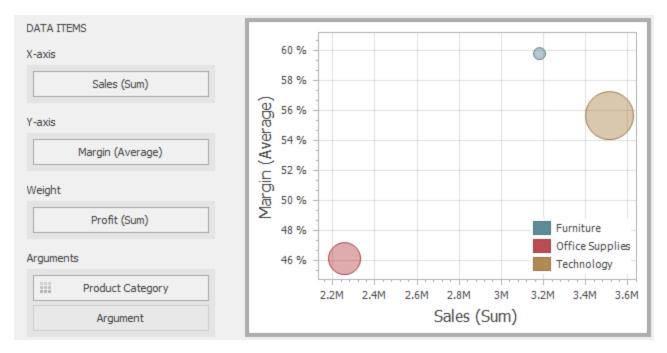

# **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Scatter Chart dashboard item to data in the Designer.

### Binding to Data in the Designer

The image below shows a sample Scatter Chart dashboard item that is bound to data.

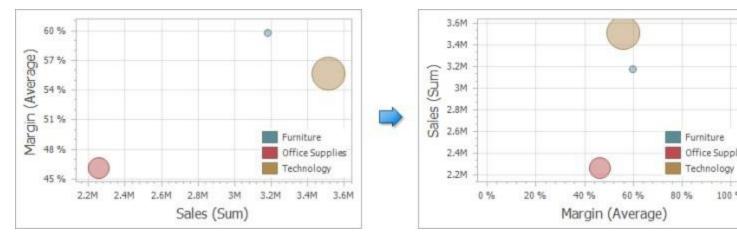

To bind the Scatter Chart dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes Scatter Chart data sections.

Section	Description
X-Axis	Contains the data item against which the X- coordinates of data points are calculated.
Y-Axis	Contains the data item against which the Y- coordinates of data points are calculated.
Weight	Contains the data item whose values are used to calculate the weight of data points.
Arguments	Contains Data Items providing scatter chart arguments that are used to create data points.

### Transposing X and Y axis

The Scatter Chart dashboard item provides the capability to transpose its axes. In this case, the data item contained in the X-Axis section is moved to the Y-Axis section, and vice versa.

To transpose the selected Scatter Chart dashboard item, use the Transpose button in the Home ribbon tab.

### Interactivity

This section describes features that enable interaction between the Scatter Chart and other dashboard items. These features include Master Filtering and Drill-Down.

### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

The Scatter Chart dashboard item supports filtering by points that correspond to specific argument values or their combinations.

When Master Filtering is enabled, you can click a point (or multiple points by holding down the CTRL key) to make other dashboard items only display data related to the selected point(s).

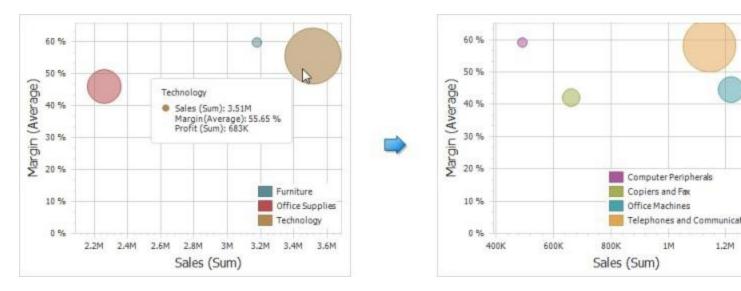

Computer Peripherals Copiers and Fax	491
	551
	00.
Office Machines	1.22
Telephones and Communication	1.14
-	
- 1	

To reset filtering, use the **Clear Master Filter** ( $\mathbf{T}_{\mathbf{x}}$ ) button in the Chart's caption area, or the Clear Master Filter command in the context menu.

#### **Drill-Down**

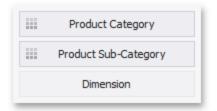

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly.

When drill-down is enabled, you can click a point to view the details

When Master Filtering is enabled, you can view the details by double-clicking a point.

Drill-down requires that the Arguments section contain several dimensions, from the least to the most detailed dimension.

To enable drill-down, click the **Drill Down** button in the Data Ribbon tab (or the <sup>3</sup> button if you are using the toolbar menu).

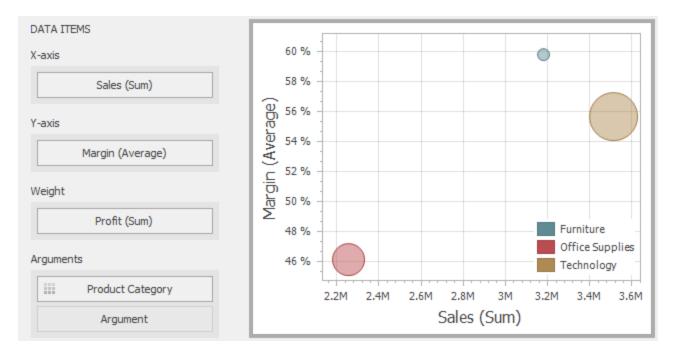

To return to the previous detail level (drill up), use the **Drill Up** (<sup>5</sup>) button in the caption of the Scatter Chart dashboard item, or the Drill Up command in the context menu.

# Coloring

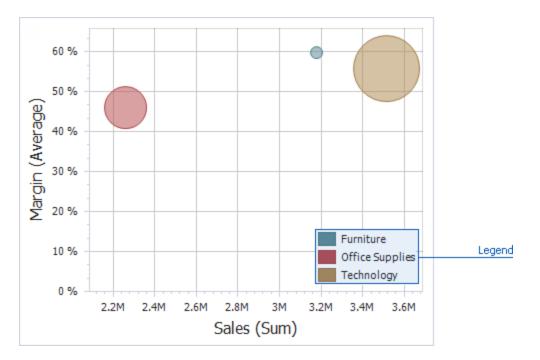

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

By default, the Scatter Chart dashboard item does not color its arguments. If necessary, you can change this behavior. For instance, the image below displays the Scatter Chart dashboard item whose Produ ct Category points are colored by hue.

### Legend

A legend is an element of a scatter chart that identifies chart points (for instance, colored points corresponding to argument values).

This topic describes how to customize various legend settings.

### Visibility

You can specify whether or not a chart should display a legend

In the Designer, use the Show Legend button in the Legend section of the Design Ribbon tab.

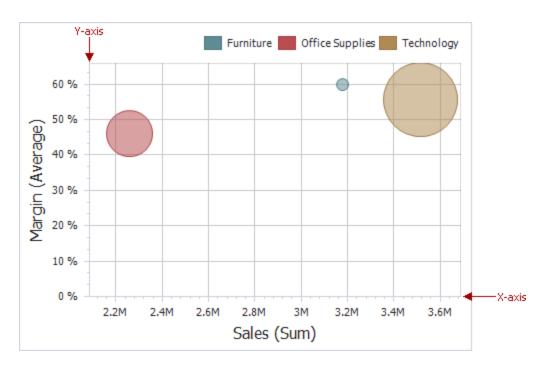

### **Position and Orientation**

Inside Horizontal		*
Inside Ve	rtical	3

To specify the legend's position and orientation, select one of the predefined options from the gallery in the Design Ribbon tab.

#### Axes

Scatter Chart X and Y-axes are numerical axis of values. You can specify various axes settings to change visual data presentation.

To access X and Y-axis settings, use the X-Axis Settings/Y-Axis Settings buttons in the **Diagram** section of the Design Ribbon tab.

This will invoke the X-Axis Settings/Y-Axis Settings dialog.

Y-Axis Settings	x
Always show zero level	
Reverse	
Show grid lines	
Show Y-axis	
🗹 Show title	
<ul> <li>Default text</li> </ul>	
Custom text	Gross Profit Margin
Logarithmic scale	10 -
	OK Cancel

In this dialog, you can specify the following settings:

**Always show zero level**: Specifies whether or not the axis' zero level is visible. If this option is unchecked, the visible axis range is defined based on the values plotted in the chart. Note that the X-Axis setting dialog does not contain this option.

**Reverse**: Allows you to reverse the axis. If the axis is reversed, its values are ordered from top to down.

Show grid lines: Allows you to hide and show grid lines for the axis.

Show axis: Allows you to hide and show the axis

**Show title**: Allows you to hide and show the axis title. You can choose whether to use the default text or specify a custom string.

**Logarithmic scale**: Specifies whether or not the axis should display its numerical values using a logarithmic scale. The combo box next to this option allows you to select the logarithmic base from one of the predefined values.

#### Orientation

You can rotate the Scatter Chart so that the X-axis becomes vertical, and the Y-axis becomes horizontal. To rotate a Chart in the Designer, use the **Rotate** button in the **Diagram** section of the Design Ribbon tab.

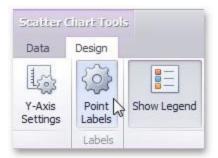

### Labels

The Scatter Chart display can display point labels that contain descriptions for data points, and provide tooltips with additional information.

	Tooltip	
•	ce Supplies Sales (Sum): 2.26M Margin(Average): 46.09 % Profit (Sum): 452K	Technology
Office Supplies	Point Labels	

### **Point Labels**

To manage the visibility of point labels, click the Point Labels button in the Design ribbon tab.

In the invoked Point Label Settings dialog, enable the Show point labels check box to show point labels.

Point Label Settings	x
Show point labels:	$\checkmark$
Content:	Argument 🔻
Overlapping mode:	Hide overlapping labels 🔹
Orientation:	Default 👻
	OK Cancel

You can specify the following settings for point labels:

- **Content**: Specifies the type of content displayed within point labels. You can select one of the following options:
  - Values: Point labels show summary values from X and Y-axes.
  - Argument: Point labels show argument values.
  - Argument and values: Point labels show argument values and corresponding summary values.
  - Weight: Point labels show the weight summary value.
  - **Argument and weight**: Point labels show the argument value and the corresponding weight summary value.
- Overlapping mode: Specifies the label overlap mode. The following options are available:
  - **Hide Overlapping labels**: If two or more labels overlap, some of them are automatically hidden to avoid overlapping.
  - **None**: The overlapping resolving algorithm is disabled.

- **Reposition overlapping labels**: The default algorithm to re-position point labels in a random way, and avoid overlapping labels.
- **Orientation**: Specifies the orientation of point labels. The following options are available:
  - **Default**: A point label is displayed in its default orientation.
  - Rotate to the Right: A point label is rotated 90 degrees clockwise.
  - Rotate to the Left: A point label is rotated 90 degrees counter clockwise,

# Grid

The topics in this section describe the features available in the Grid dashboard item, and provide extensive information on how to create and customize grids in the Dashboard Designer.

State	Trend	Sales 📍	Sales vs Target
Washington	·	\$269M	-6.49 % 🔻
New York	· · · · · · · · · · · · · · · · · · ·	\$266M	+9.39 % 🔺

Missouri	•	\$152M	+6.27 % 🔺

# **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Grid dashboard item to data in the Designer.

The image below shows a sample Grid dashboard item that is bound to data.

DATA ITEMS		Sales by State	•		B
Columns		State	Sales	Sales vs Target	Trend
↓ State	12	Indiana	\$160M	-3.16 % 🔻	·
•		Illinois	\$146M	-2.56 % 🔻	/^
Sales (Sum)	Σ	Alabama	\$117M	+3.62 % 🔺	
		Arizona	\$103M	+2.76 % 🔺	·
		California	\$98.8M	-0.81 % 🔻	· ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Sales (Sum)	$\Delta$	Mississippi	\$97.9M	+2.76 % 🔺	
SalesTarget (Sum)	$\Delta$	Idaho	\$93.4M	+4.03 % 🔺	
		Minnesota	\$90.8M	+2.70 % 🔺	·
Sales (Sum)		Maine	\$89.7M	+2.09 % 🔺	· · · · · · · · · · · · · · · · · · ·
Sales (Sully		Michigan	\$82.8M	+1.00 % 🔺	
		Connecticut	\$79.2M	+2.34 % 🔺	·
New Column	A	Georgia	\$75.7M	+1.70 % 🔺	· · · · · · · · · · · · · · · · · · ·
- 11		Florida	\$74.8M	+3.20 % 🔺	·
Sparkline		Massachusetts	\$72.9M	+3.72 % 🔺	·
↑ CurrentDate (Month-Year)		Colorado	\$72.4M	+1.55 % 🔺	·
		Kentucky	\$63.6M	+1.28 %	

To bind the Grid dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes a Grid's data sections.

Section	Description
Columns	Contains Data Items that provide values for grid columns. The Option s button next to the Column data item allows you to select the column type and specify their options.
Sparkline	Contains a data item that provides arguments for sparkline columns. To learn more, see Sparkline Column.

The Grid displays data in a two-dimensional table that supports four types of columns.

Dimension C	olumn	Measure Column	Delta Column	Sparkline Column
	State	Sales	Sales vs Target	Sales (Sum)
	Kentucky	\$339M	+9.34 % 🔺	· · · · · ·
	Florida	\$234M	+2.14 % 🔺	•
	Colorado	\$167M	+6.83 % 🔺	
	California	\$165M	+1.10 % 🔺	

- The dimension column displays values from the bound data item "as is".
- The measure column displays summaries calculated from data in the bound data item.
- The **delta column**, bound to two measures, calculates summaries for both measures, and displays the difference between these summaries.
- The **sparkline column** visualizes the variation of summary values over time.

To sort records by a column's values and replace existing sort conditions that are applied to the current or other columns, click the target column's header until an Up or Dow n arrow icon is displayed within the header. The Up and Dow n arrows indicate ascending and descending sort orders, respectively.

Sales by State			$\square \mathbb{T}_{\!\times}$
State	Sales		
Colorado		5	\$137M
Ohio			\$137M
Indiana			\$132M
Wisconsin			\$131M
Minnesota			\$126M

To sort records by a column's values while preserving existing sort conditions, click a column header while holding the **Shift** key until an Up or Down arrow icon is displayed within the header.

Product Sales YTD				
Category	٠	Product	•	7
Accessories		Cable Lock	5	
Accessories		Bike Wash		
Accessories		All-Purpose Bike S	tand	
Bikes		Touring-3000		
Bikes		Touring-2000		
Bikes		Touring-1000		

To remove sorting by a column, click a column header while holding down the CTRL key.

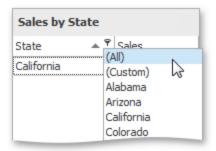

To filter grid data, click the filter button (the icon) and select the required filter value in the invoked filter drop-down list.

Sales by State	
State 🔺	9 Sales
Alabama	(Custom) Alabama
Arizona	Arizona
California	California
Colorado	Colorado
Connecticut	Connecticut Florida
Florida	Georgia

Click **Custom** to construct filter criteria involving up to two conditions. This will invoke the Custom AutoFilter dialog, allowing you to compare a column with one or two values.

Custom AutoFilter		>	۲.
Show rows where: Sales

And Or			
Is less than	✓ 200		
	0	K Cancel	

To clear the filter applied to a specific column, invoke the filter drop-down list and click All.

To clear all filter criteria, click the **Close Filter** button within the Filter Panel.

	Sales by State			$\square \mathbb{T}_{\!\times}$
	State	۴ 🛦	Sales	٣
	California			\$118M
	Colorado			\$137M
Close Filter[	× ✓ [State] <= 'G	eorgia' An	d [Sales] > '\$100M'	1

A Grid dashboard item can display a tooltip when the mouse pointer is hovered over the bar in the measure column.

Sales	Sales
	\$85.8M
	\$77.1M
N	\$190M
\$190M	\$152M

The tooltip shows the value in the measure column as text.

When the mouse pointer is hovered over the cell in the sparkline column, the tooltip can display start/end values and minimum/maximum values.

# Columns

The topics in this section describe the different types of grid columns, and contain information on when to use each column type and how to customize them based on the type.

# **Column Type Overview**

The Grid dashboard item supports four types of columns:

- Dimension Column: Displays values in the bound data item "as is".
- Measure Column: Displays summaries calculated against data in the bound data item.
- **Delta Column**: Bound to two measures, it calculates summaries for both measures, and displays the difference between these summaries.
- Sparkline Column: Displays values in the bound data item using sparklines.

Dimension C	olumn	Measure Columr	Delta Column	Sparkline Column
	State 📍	Sales	Sales vs Target	Sales (Sum)
	Kentucky	\$339M	+9.34 % 🔺	· · · · · · · · · · · · · · · · · · ·
	Florida	\$234M	+2.14 % 🔺	•
	Colorado	\$167M	+6.83 % 🔺	
	California	\$165M	+1.10 % 🔺	

When you drop a data item into the Columns section, the type for the new column is determined automatically, based on the data type.

# **Column Type Indication**

The type of the column is indicated within the corresponding data item container in the Data Items area.

Column type indicators are defined as follows:

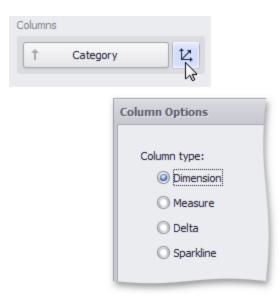

**Dimension Column** 

Ľ,

# **Changing Column Type**

To change the column type, click the column type indicator. In the invoked Column Options window, select the required column type in the Column type section.

# **Dimension Column**

Dimension C	olumn	1	Measure Column	Delta (	Column		Sp	oarkline Column
	State	۴	Sales	Sales vs Tarç	jet	Sales (Sum)		
	Kentucky		\$339M	+9.3	4%		<u> </u>	
	Florida		\$234M	+2.1	4%		~~~	
	Colorado		\$167M	+6.8	3 %	<u> </u>	~~~^•	
	California		\$165M	+1.1	0 %	<u> </u>	~~~~~	

The dimension column displays values from the bound data item "as is".

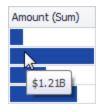

If the dimension column is bound to a data source containing images, it can display images.

### **Measure Column**

A measure column displays summaries calculated against data in a bound data item.

Dimension C	olumn	Measure	e Column	Delta	Column		Sp	oarkline Column
	State	7 Sales	· · · · · ·	Sales vs Tar	rget	Sales (Sum)		
	Kentucky		\$339M	+9.	34 % 🔺		<u> </u>	
	Florida		\$234M	+2.	14 % 🔺	•	~~~	
	Colorado		\$167M	+6.	83 % 🔺		~~~^•	
	California		\$165M	+1.	10 % 🔺	<u> </u>	~~~~	

Values in the measure column can be displayed as text or represented by bars.

To select between these modes, invoke the Column Options window and select Value or Bar.

Column Options	
Column type: Dimension Measure Delta Sparkline	Show: Value Show Bar Always show zero level

If bars are displayed, use the Always show zero level check box to specify whether the bar's zero level is always visible.

## **Delta Column**

A delta column calculates summaries against two measures, and displays the difference between these summaries. This difference can be indicated with a numeric value displayed within the delta element and an additional delta indication.

Amount (Sum) vs Taxes (Sum)		
	+227M	
	+1.12B	
	+513M	
	+903M	
Delta Values — Delta Indication		

## **Data Binding Specifics**

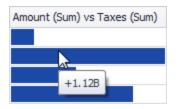

Delta columns are bound to two measures that provide two values: the Actual value and the Target value. The difference between these values is displayed in the column.

When you switch the column type to Delta, the data item container is changed, to accept the Actual and Target measures.

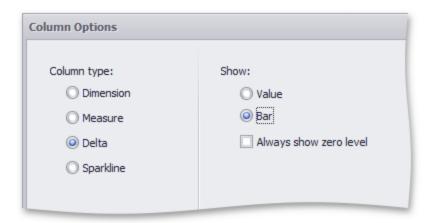

DATA ITEMS	
Columns	
Sales (Sum)	Α
SalesTarget (Sum)	Δ
Actual	
Target	Δ

# **Display Mode**

Values in the delta column can be displayed as text, or represented by bars.

To select between these modes, invoke the Column Options window and select Value or Bar.

If bars are displayed, use the Always show zero level check box to specify whether the bar's minimum value is zero (checked) or an automatically selected value that ensures that the difference between bars is clearly displayed (unchecked).

AlwaysSh	wZeroLevel ==	true AlwaysSh	owZeroLevel == f	alse
Sales	Sales	Sales	Sales	
	5	\$79.5M	\$7	9.5M
	5	\$80.3M	\$8	0.3M
	5	\$85.6M	\$8	5.6M
		\$86.6M	\$8	6.6M
	<u> </u>	\$87.3M	\$8	7.3M

# **Delta Values and Indication**

If the display type is set to Value, the Column Options window displays options that allow you to configure delta values and indication.

Column Options			x
Column type: Dimension Measure O Delta Sparkline	Show: Value Bar Value type: Result indication: Threshold type: Threshold value:	Absolute variation Greater is good Percent	▼ ▼ 0 ▲
	OK	Cancel	0 🗘

You can specify which values should be displayed in the delta column. To do this, use the Value type combo box in the Column Options window.

#### Actual Value Absolute Variation Percent Variation Percent of Target

To specify the condition for displaying delta indication, use the **Result** indication combo box in the Column Options window.

#### Greater is Good Less is Good Warning if Greater Warning if Less No Indication

| Sales vs Target |
|-----------------|-----------------|-----------------|-----------------|-----------------|
| +5.32 % 🔺       | +5.32 % 🔺       | +5.32 % 🔴       | +5.32 %         | +5.32 %         |
| -0.95 % 🔻       | -0.95 % 🔻       | -0.95 %         | -0.95 % 🔴       | -0.95 %         |
| +8.02 % 🔺       | +8.02 % 🔺       | +8.02 % 🔴       | +8.02 %         | +8.02 %         |
| -1.51 % 🔻       | -1.51 % 🔻       | -1.51 %         | -1.51 % 🔴       | -1.51 %         |

## **Comparison Tolerance**

The comparison tolerance allows you to specify more advanced conditions for displaying delta indication. For instance, you can set a specific indication to be displayed when the actual value exceeds the target value by 10% or by 2K.

Use the **Threshold** type combo box to select whether you wish to specify the comparison tolerance in percentage values or in absolute values. Then use the Threshold value box to specify the comparison tolerance.

Column Options			x
Column type: Dimension Measure O Delta	Show: Value Bar Value type:	Absolute variation	-
Sparkline	Result indication: Threshold type: Threshold value:	Greater is good Percent	▼ ▼ 0 ‡
	OK	Cancel	Apply

# Sparkline Column

A sparkline column visualizes the variation in summary values over time.

	Sparkline column	
CategoryName	Extended Price	
Beverages	\$49.1K •\$20.3K	
Condiments	\$9.99K ••\$7.32K	
Produce	\$4.23K 🚅 🔷 \$15.3K	

# **Data Binding Specifics**

The sparkline column is bound to a measure providing sparkline values and to a dimension providing a date-time interval.

DATA ITEMS	
Columns	
Extended Price (Sum)	~~~
Dimension	12,
Sparkline	
OrderDate (Month)	

# **Sparkline Options**

You can control sparkline appearance settings using the Column Options dialog. To invoke this dialog, click the column type indicator (......).

Column Options	x
Column type: Dimension Measure Delta Sparkline	<ul> <li>Show start/end values</li> <li>Sparkline view type: Line</li> <li>Highlight min/max points</li> <li>Highlight start/end points</li> <li>OK Cancel Apply</li> </ul>

In this dialog, you can control various settings that affect how the sparkline is displayed within a grid cell.

Sparkline Options	Description
Show start/end values	Species whether or not to display sparkline start/end values within a grid cell.
Sparkline view type	Defines the view type of a sparkline. Sparkline view types include Line, Area, Bar, and Win/Loss.
Highlight min/max points	Specifies whether or not to highlight the minimum/ maximum points of a sparkline.
Highlight start/end points	Specifies whether or not to highlight the start/end points of a sparkline.

# Interactivity

This section describes features that enable interaction between the Grid and other dashboard items. These features include Master Filtering and Drill-Down.

## **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

### **Configure Master Filters in the Designer**

The Grid dashboard item supports filtering by rows.

When Master Filtering is enabled, you can click a grid row (or multiple rows by holding down the CTRL key) to make other dashboard items only display data related to the selected record(s).

State 📴 🏹	Sales by Product		Ы
Alabama Arizona California Colorado Connecticut Florida	All-Purpose Bike Stand Accessories \$392K +4.85 % +18.1K	Bike Wash Accessories	\$26.6K +9.91 % +2.4K

To reset filtering, use the Clear Master Filter button (the  $\mathbf{T}_{\mathbf{x}}$  icon) in the grid's caption area, or the **Clear Master Filter** command in the grid's context menu.

<b>?</b>	Edit Filter Clear
	Clear Master Filter
	Print Preview

# **Drill-Down**

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly.

The Grid dashboard item supports drill-down for rows.

When drill-down is enabled, you can click a grid row to view the details.

Amount (Sum)
\$247M
\$1.21B
\$558M
\$98 1M

When Master Filtering is enabled, you can view the details by double-clicking a grid row.

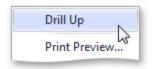

Drill-down requires that the Columns section contains several dimensions at the top, from the least detailed to the most detailed dimension.

	Category	Amount (Sum)
umns	Accessories	\$247M
† Category 12	Bikes	\$1.21B
	Clothing	\$558M
1 Subcategory 12	Components	\$98 1M
↑ Product 12		
· · · · · · · · · · · · · · · · · · ·		
Amount (Sum)		
Dimension 🖄		

To enable drill-down, click the Drill Down button in the Data Ribbon tab (or the  $\Im$  button if you are using the toolbar menu).

To return to the previous detail level (drill up), use the Drill Up button (the sicon) within the grid's caption area, or the **Drill Up** command in the grid's context menu.

# **Conditional Formatting**

The Grid dashboard item supports the conditional formatting feature that provides the capability to apply formatting to grid cells whose values meet the specified condition. This feature allows you to highlight specific cells or entire rows using a predefined set of rules.

## **Conditional Formatting Overview**

The Grid dashboard item allows you to apply conditional formatting to Data Items providing data to the following column types:

- Dimension column
- Measure Column
- Sparkline Column

Note that you can use hidden measures to specify a condition used to apply formatting to visible values. New appearance settings are applied to grid cells corresponding to the target dimension/measure values.

# **Create a Formal Rule**

To create a new format rule for the grid's dimension/measure, do one of the following.

Click the **Options** button next to the required measure/dimension, select **Add Format Rule** and choose the condition.

New Column	Count Count Distinct ✓ Sum		S Greater Than
	Min	X Value	<ul> <li>Greater Than</li> <li>Greater Than Or Equal T</li> </ul>
	Max	Top/Bottom	Less Than
	Average	🗵 Average	Less Than Or Equal To
	More	Expression	Equal To
	Format	🧬 Icon Ranges	Mot Equal To
	Add Format Rule	🕨 🚽 Color Ranges	Between
	🖏 Edit Rules	🧰 Gradient Ranges	Not Between
	🗐 Clear Rules	👍 Bar	Between Or Equal To
	Rename	📴 🛛 Bar Color Ranges	Not Between Or Equal T
		📕 🚉 🛛 Bar Gradient Ranges	Text that Contains

Right-click the column header corresponding to the required measure/dimension and select **Add Format Rule**.

Sales Person	Extended Price	AB	Fit to Content			
Margaret Peacock				X	Value	•
Janet Leverling		HOH	Fix Width	1.	Top/Bottom	•
Nancy Davolio		H-H	Column Width	x	Average	•
Andrew Fuller			Add Format Rule	P	Icon Ranges	•
Laura Callahan		眠.	Edit Rules		2	
Robert King		1 <u>0</u> 1	Edit Kules		Color Ranges	•
Anne Dodsworth		疁	Clear Rules	-	Bar Color Ranges	•
Michael Suyama			Add Total		Gradient Ranges	•
Steven Buchanan		0.0	Clear Totals		Par Gradient Panger	
		×	Clear Totals		Bar Gradient Ranges	
				-	Bar	
				f	Expression	

Depending on the selected format condition, the dialog used to create a format rule for Grid contains different settings. For instance, the image below displays the Greater Than dialog corresponding to the Value format condition.

Greater Than ×	
Format <i>Extended Price</i> values that are greater than	
Appearance Icons	
B I U Gr R Y G B Custom Appearance	
Apply to Extended Price	
Apply to row	
OK Cancel Apply	

The **Apply to row** check box allows you to specify whether to apply the formatting to the entire grid row.

## Edit a Format Rule

To edit format rules for the current Grid dashboard item, use the following options:

- Click the **Edit Rules** button in the Home ribbon tab or use corresponding item in the Grid context menu.
- Click the menu button for the required data item and select **Edit Rules**. As an alternative, right-click the column header corresponding to the required data item and select Edit Rules.

All of these actions invoke the Edit Rules dialog containing existing format rules.

# Totals

The Grid dashboard item enables you to add a summary value (a total) calculated against displayed values of an individual column, and show the result under this column. Note that you can add any number of totals for each column. For example, you can obtain the number of column records, average or maximum value, etc.

Category	Extended Price (Sum)	Discount (Average)
Beverages	\$268K	6.19 %
Condiments	\$106K	5.26 %
Confections	\$167K	5.69 %
Dairy Products	\$235K	5.34 %
Grains/Cereals	\$95.7K	4.53 %
Meat/Poultry	\$163K	6.45 %
Produce	\$100K	4.54 %
Seafood	\$131K	6.02 %
Count = 8	Max = \$268K	Avg = 5.50 %
	Sum = \$1.27M	

# **Totals Overview**

You can use the following summary functions when creating totals:

- Count: The number of records
- Sum: The sum of the values

$$Sum = \sum_{i} v_i$$

- Min: The smallest value
- Max: The largest value
- Average: The average of the values

$$\bar{v} = \frac{1}{n} \cdot \sum_{i} v_i$$

• Auto: The total is calculated using the type of summary function specified for the measure corresponding to the current Grid column. Note that in this case, the total is calculated based on values of the corresponding data field from the underlying data source.

You can create totals using different sets of summary functions. This depends on the type of the data source field providing data for the target column.

#### Icon Data Source Field Type Supported Totals

~	Boolean	Count
101	Byte	Count
0	Date-time	Min,Max,Count
123 1,2	Numeric	Allavailabletypes
ab	String	Min,Max,Count

Note that the Auto type is available only for the Measure column.

# **Create and Edit Tools**

To create a total, use the context menu of the column header. Right-click the required column header, select Add Total and specify the type of summary function used to calculate a total.

Category	Extended Price (Sum)		Discount (Average)			
Beverages	\$26	AB	Fit to Content			
Condiments	\$10	HOH	Fix Width			
Confections	\$16		Column Width

Count = 8	Мах		Add Total	
	Sum	2	Clear Totals	
	Sum		3	

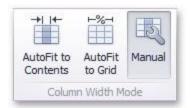

# Layout

The Grid dashboard item allows you to customize its layout in various ways. You can manage the width of grid columns, specify the visibility of column headers, enable cell merging, etc.

To do this, use the Layout and Column Width Mode groups in the Design Ribbon tab.

The Grid dashboard item allows you to manage column widths using different modes. Use buttons in the Column Width Mode group to manage the column width modes.

The following modes are available:

- AutoFit to Contents: The grid adjusts columns to the minimum width required to completely display their content automatically. If the entire content cannot be displayed within the dashboard item, horizontal scrolling is enabled.
- AutoFit to Grid: The grid adjusts the width of all columns to fit their content in an optimal way. If you are changing the size of the dashboard item, the width of columns is changed proportionally..
- Manual: The grid allows you to adjust column widths manually.

In this mode, you can adjust the width of individual columns in the following ways:

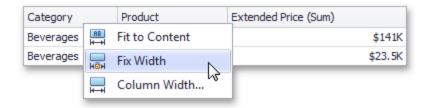

Specify the width of the required column by dragging the right edge of the column header

Category	Product	Extended Price (Sum)
Beverages	Côte de Blaye	\$141K
Beverages	Ipoh Coffee	\$23.5K

In this case, all columns preserve their relative size when the grid width is changed.

Column Width			x
Column width:	17.32	ОК Са	incel

Specify the column width and fix it by right-clicking the required column header and selecting **Fix Width**.

You can also specify the fixed column width by selecting Column Width. This invokes the Column Width window that allows you to specify the width of the column in characters.

Fit the column width to its content and fix it by right-clicking the required column header and selecting Fit to Content.

### **Column Header**

Use the Column Headers button to toggle column header visibility.

Category	Amount (Sum)			
Accessories	\$247M		Accessories	\$247M
Bikes	\$1.21B		Bikes	\$1.21B
	1	-	Clothing	\$558M
Clothing	\$558M		Components	\$981M
Components	\$98 1M			

# **Cell Merging**

The Grid allows you to merge neighboring cells with identical values . To do this, use the **Merge Cells** button.

Category	Product	Extended Price (Sum)
Beverages	Côte de Blaye	\$141K
Beverages	Ipoh Coffee	\$23.5K
Confections	Tarte au sucre	\$47.2K
Confections	Sir Rodney's Marmalade	\$22.6K
Confections	Gumbär Gummibärchen	\$19.8K
Category	Product	Extended Price (Sum)
Category	Product	Extended Price (Sum)
	Product Côte de Blaye	Extended Price (Sum) \$141K
Category Beverages		
	Côte de Blaye	\$141K
	Côte de Blaye Ipoh Coffee	\$141K \$23.5K

Note that the banded rows are not available when cell merging is enabled.

# Word Wrapping

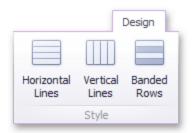

The word wrapping feature enables the capability to display cell content on multiple lines if the size of a dashboard item is insufficient to completely display the cell content on a single line.

Category	Product		Extended Price (Sum)	
Beverages	Côte de Blay	e	\$141	ĸ
Beverages	Ipoh Coffee		\$23.5	ĸ
Category	Product	Exte	ended Price (Sum)	
Beverages	Côte de Blaye		\$141K	
Beverages	Ipoh Coffee		\$23.5K	

The word wrapping feature is not in effect when the **AutoFit to Contents** column width mode is enabled.

# Style

The Grid dashboard item allows you to specify various style settings. To do this, use the **Style** group in the Design Ribbon tab.

# **Grid Lines**

The Horizontal Lines and Vertical Lines buttons control grid line visibility

Category	Amount (Sum)			
Accessories	\$247M		Accessories	\$247M
Bikes	\$1.21B		Bikes	\$1.21B
Clothing	\$558M	-	Clothing	\$558M
Components	\$981M		Components	\$981M

# **Banded Rows**

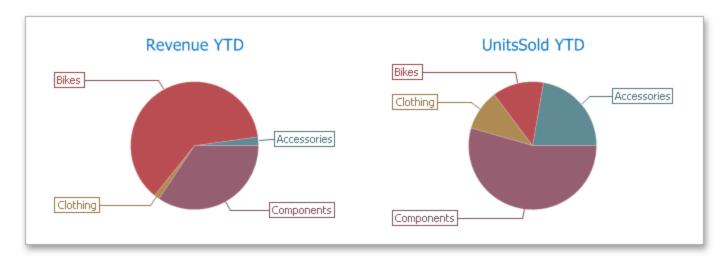

To paint the background of odd and even rows differently, use the **Banded Rows** button.

Category	Product	Extended Price (Sum)
Beverages	Côte de Blaye	\$141K
Beverages	Ipoh Coffee	\$23.5K
Confections	Tarte au sucre	\$47.2K
Confections	Sir Rodney's Marmalade	\$22.6K
Confections	Gumbär Gummibärchen	\$19.8K

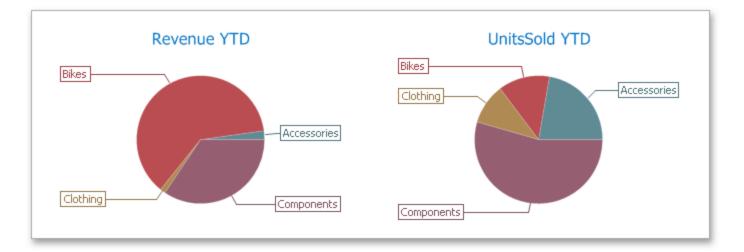

Banded rows are not available when cell merging is enabled.

# Pies

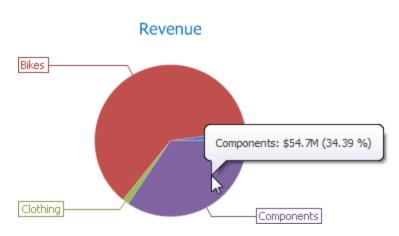

The Pie dashboard item displays a series of pies or donuts that represent the contribution of each value to a total.

The Pie dashboard item displays a series of pies or donuts that represent the contribution of each value to a total.

A Pie dashboard item can display a tooltip that shows information about the hovered pie segment.

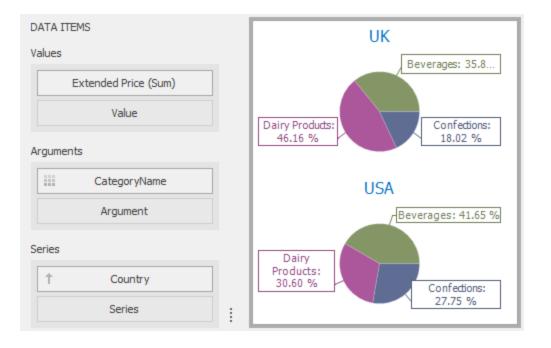

# **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Pie dashboard item to data in the Designer.

# Binding to the Data in the Designer

The image below shows a sample Pie dashboard item that is bound to data,

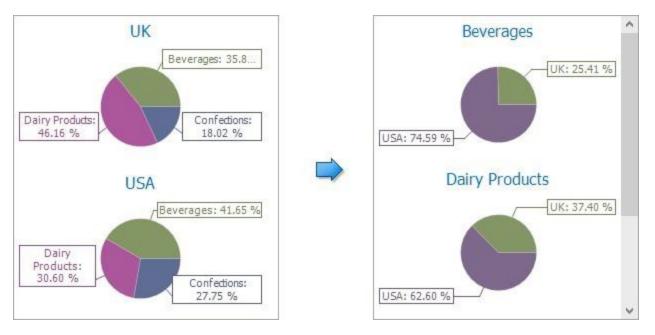

To bind the Pie dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes Pie's data sections.

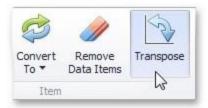

Section	Description
Values	Contains Data Items that define the share of pie segments. In case of negative measure values, Pie uses their absolute values.
Arguments	Contains Data Items that provide values used to label pie segments.
Series	Contains Data Items whose values are used to label pie charts.

## **Transposing Arguments and Series**

The Pie dashboard item provides the capability to transpose pie arguments and series. In this case, Data Items contained in the Arguments section are moved to the Series section, and vice versa.

To transpose the selected Pie dashboard item, use the Transpose button in the Home ribbon tab.

# Interactivity

This section describes features that enable interaction between the Pie dashboard item and other items. These features include Master Filtering and Drill-Down.

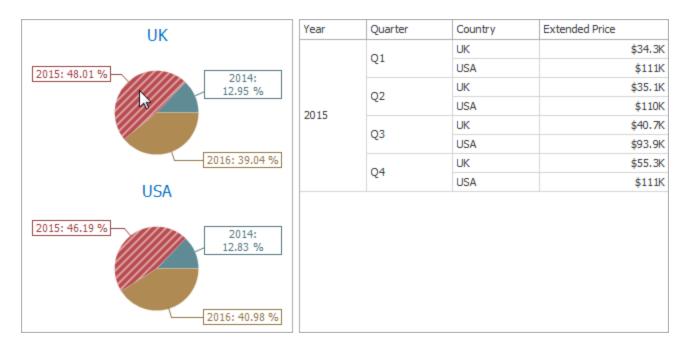

## **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

The Pie dashboard item supports filtering by argument or series values.

# **Filtering by Arguments**

When filtering by arguments is enabled, you can click a pie segment to make other dashboard items only display data related to the selected argument value.

To enable filtering by arguments in the Designer, set the required Master Filter mode and click the **Arguments** button in the Data Ribbon tab (or the  $\triangleleft$  button if you are using the toolbar menu).

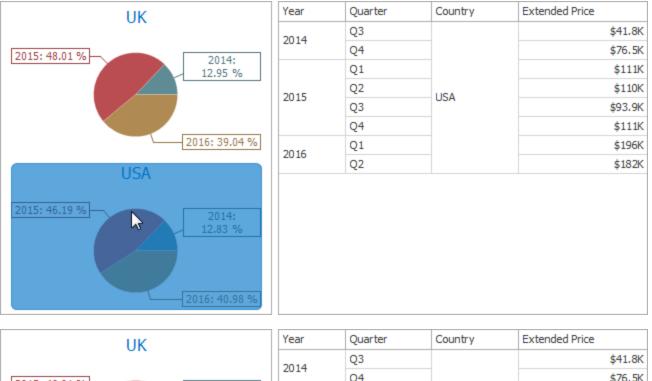

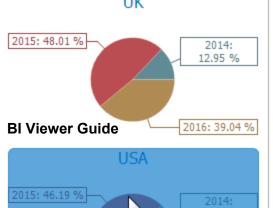

## Filtering by the Series

When filtering by series is enabled, you can click a pie to make other dashboard items display only data related to the selected pie.

To enable filtering by series in the Designer, set the required Master Filter mode and click the

Series button in the Data Ribbon tab (or the Context button if you are using the toolbar menu).

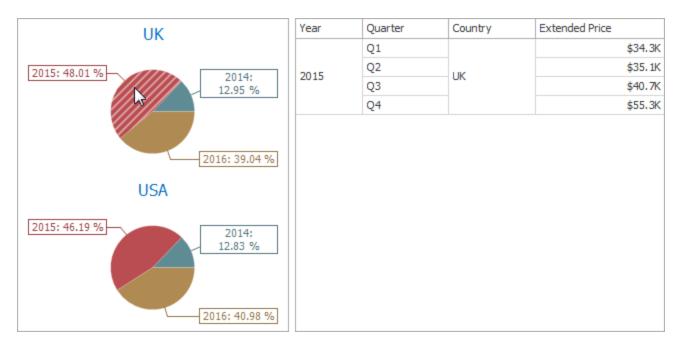

Year	Quarter	Country	Extended Price
2014	Q3		\$41.8K
2014	Q4		\$76.5K
	Q1		\$111K
2015	Q2	USA	\$110K
2015	Q3	USA	\$93.9K
	Q4		\$111K
2016	Q1		13 <b>\$</b> 196K
2010	Q2		\$182K

# **Filtering by Points**

When filtering by points is enabled, you can click a single pie segment to make other dashboard items display only data related to the selected segment.

To enable filtering by points in the Designer, set the required Master Filter mode and click the Points button in the Data Ribbon tab.

# **Reset Filtering**

To reset filtering, use the Clear Master Filter button (the  $\mathbf{x}$  icon) in the caption area of the Pie dashboard item, or the Clear Master Filter command in the Pie's context menu.

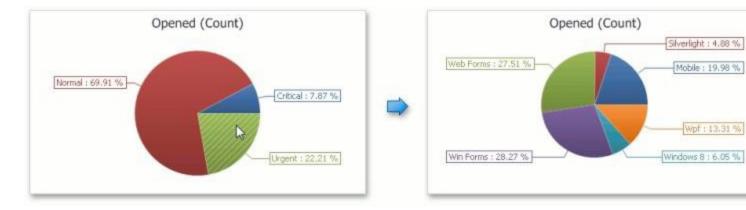

### **Drill-Down**

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly.

The Pie dashboard item supports drill-down on argument or series values.

# **Drill-Down on an Argument**

When drill down on an argument is enabled, you can click a pie segment to view a detail diagram for the corresponding argument value.

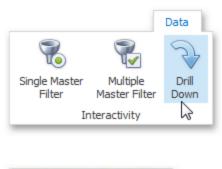

When Filtering by Arguments is enabled, you can view the details by double-clicking a pie segment.

Drill down on an argument requires that the Arguments section contains several Data Items, from the least detailed to the most detailed item.

rguments		
Ť	Category	
Ť	Subcategory	
	Argument	
	Argument	

To enable drill down on an argument, click the Drill Down button in the Data Ribbon tab (or the  $\Im$ 

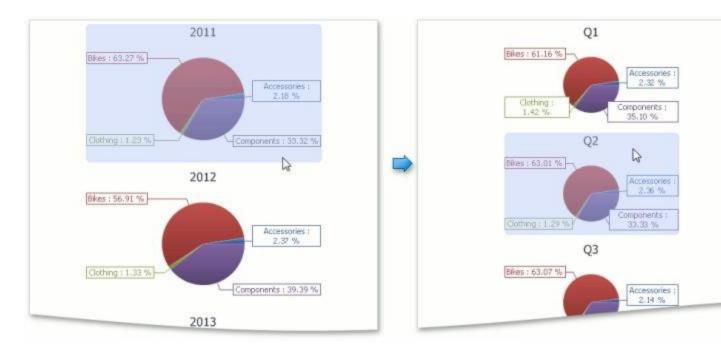

button if you are using the toolbar menu) and the Arguments button (or the  $\triangleleft$  button if you are using the toolbar menu).

## **Drill-Down on a Series**

When drill down on a series is enabled, you can click a pie chart to view a detail diagram for the corresponding series value.

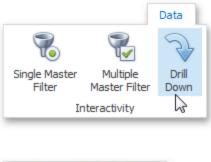

When Filtering by Series is enabled, you can view the details by double-clicking a pie chart.

Drill down on a series requires that the Series section contains several Data Items, from the least detailed to the most detailed item.

Series		
1	Date (Year)	
1	Date (Quarter)	
1	Date (Month)	
	Series	
		_

To enable drill down on a series, click the **Drill Down** button in the Data Ribbon tab (or the  $\Im$ 

button if you are using the toolbar menu) and the **Series** button (or the **Series** button if you are using the toolbar menu).

## Drill Up

To return to the previous detail level (drill up), use the Drill Up button (the sicon) in the caption area of the Pie dashboard item, or the Drill Up command in the context menu.

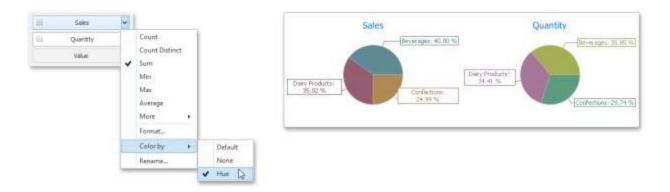

## Coloring

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

By default, the Pie dashboard item colors its segments in the following ways:

- If the Pie dashboard item contains measures (the Values section) and series dimensions (the Series section), only values corresponding to different measures are colored by hue.
- If the Pie dashboard item contains arguments (the Arguments section), different argument values are colored by hue.

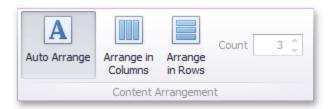

If necessary, you can change the default behavior. For instance, the image below shows the Pie dashboard item whose measures and argument values are colored by hue.

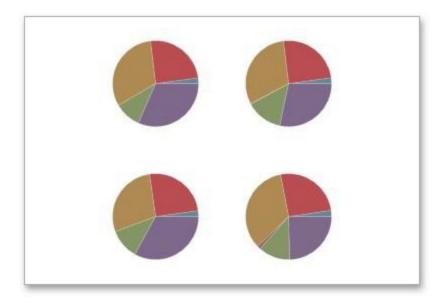

#### Layout

The Pie dashboard item allows you to specify the number of columns or rows in which individual diagrams are arranged.

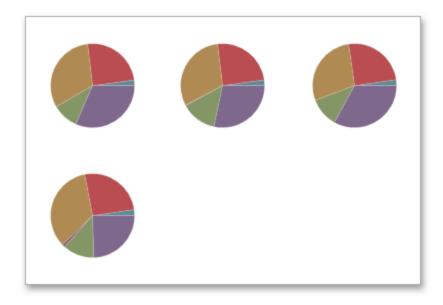

To control how pies are arranged, use the buttons in the Content Arrangement group of the Design Ribbon tab. By default, the Auto Arrange option is enabled, which automatically resizes pies to fit within the dashboard item.

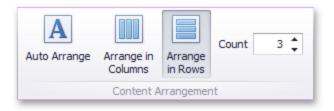

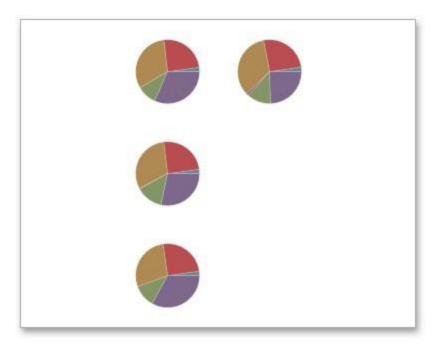

You can also specify the number of columns in which pies are arranged. Click the Arrange in Columns button and specify the appropriate number in the Count field.

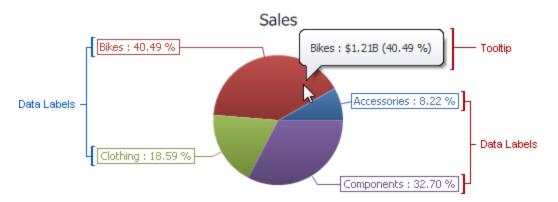

Similarly, you can arrange pies in a specific number of rows.

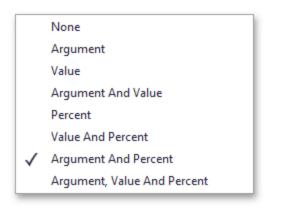

#### Labels

You can specify which information should be displayed within data labels and tooltips. To do this, use the Data Labels and Tooltips buttons in the Labels group of the Design Ribbon tab.

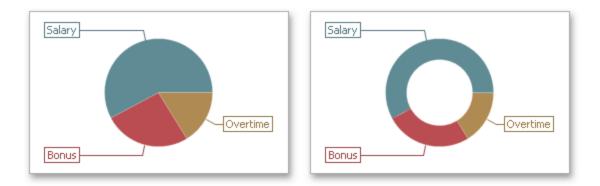

These buttons invoke a drop-down menu that is similar for both buttons. This menu allows you to specify which values are displayed within data labels or tooltips.

## Style

The Pie dashboard item allows you to select whether diagrams should be painted as pies or donuts.

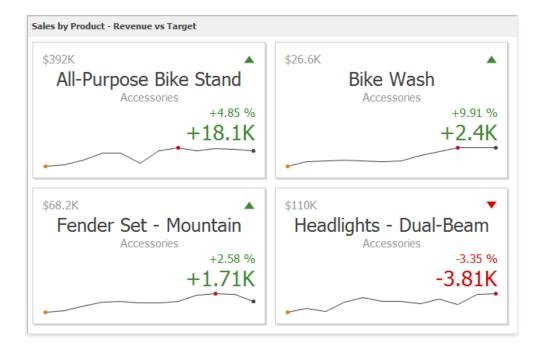

To select the diagram style, use the Pie and Donut buttons in the Style section of the Design Ribbon tab.

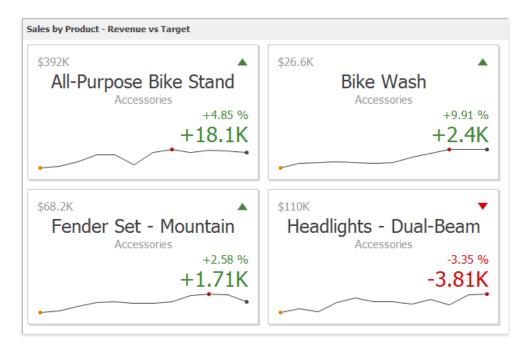

# Cards

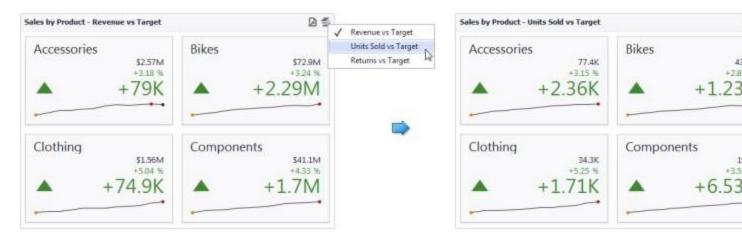

The Card dashboard item displays a series of cards. Each card illustrates the difference between two values. This difference can be expressed as an absolute value, an absolute variation or a percentage variation.

The Card dashboard item displays a series of cards. Each card illustrates the difference between two values. This difference can be expressed as an absolute value, an absolute variation or a percentage variation.

The Card dashboard item can illustrate this difference for various sets of values. You can switch between these sets using the Values button (the icon) in the dashboard item caption area or in the context menu.

A Card dashboard item can display a tooltip for cards containing a sparkline. When the mouse pointer is hovered over the sparkline, the tooltip can display start/end values and minimum/maximum values.

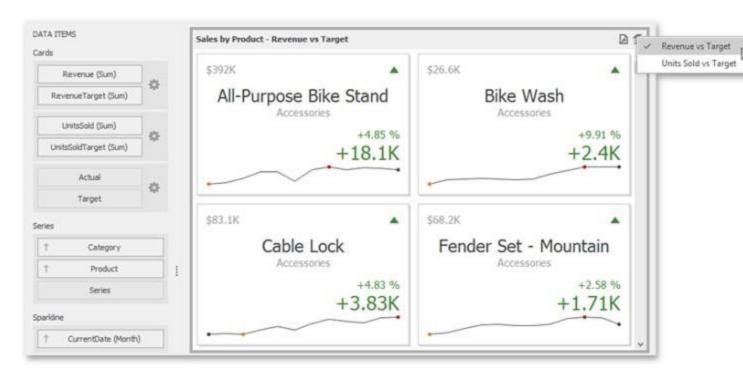

## **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Card dashboard item to data in the Designer.

#### Binding to Data in the Designer

The image below shows a sample Card dashboard item that is bound to data.

To bind the Card dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes Card data sections.

#### Section Description

Contains Data Items used to calculate values displayed within cards. Data Items are arranged in containers. Each data item container can hold two Data Items. The first item contains actu al data and the second item (optional) contains target data. If both items are provided, cards show the difference between actual and target values.

Cards You can fill several data item containers in the Cards section and use the Values dropdown menu to switch between the provided values. To invoke the Values menu, click the icon in the dashboard item caption or use its context menu. This drop-down menu is available if the Series section is not empty.

Otherwise, a separate card is created for each data item container, and all cards are displayed simultaneously.

Series Contains Data Items whose values are used to label cards.

Sparkline Provide a dimension whose data will be used to visualize values using sparklines

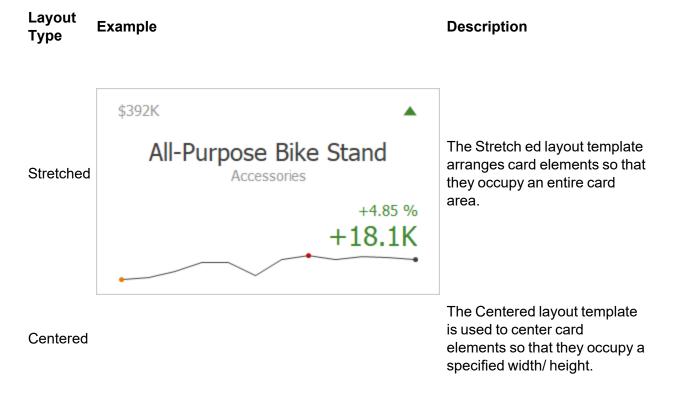

## Layout

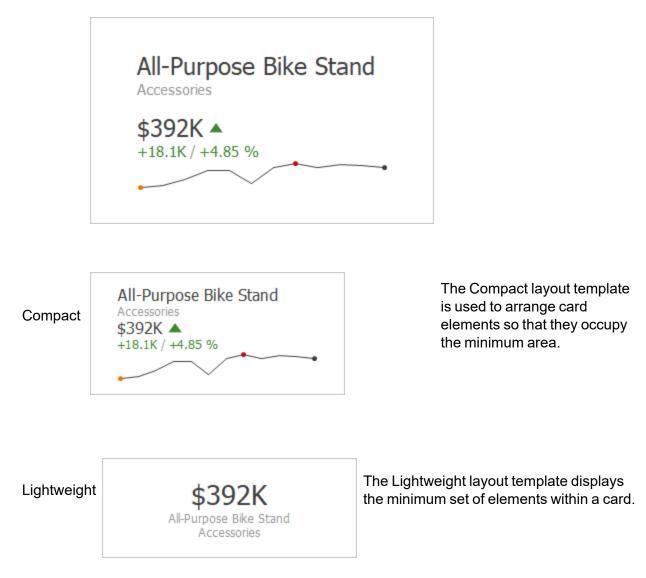

The Card dashboard item allows you to manage the position and visibility of elements displayed on cards. These elements include actual and target values, a delta indicator and corresponding delta values, a sparkline, etc.

To manage the position and visibility of card elements, choose a predefined layout template and customize its settings.

## **Available Layout Templates**

The table below contains information about the available layout templates:

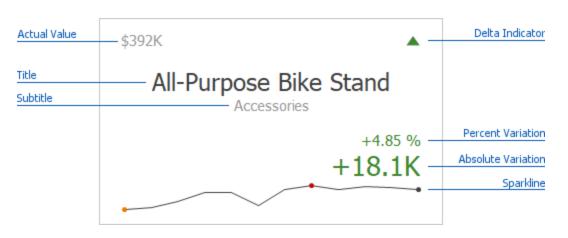

For all layout types, you can change the visibility of its elements, or you can specify the display value type for data- bound elements.

## **Default Layout**

The Card dashboard item uses the Stretched layout template that arranges card visual elements in the following way by default.

Delta Indicator and delta values (such as Percent Variation or Absolute Variation) are colored depending on delta settings.

#### **Change Layout**

To change a card's layout in the Dashboard Designer, click the Options button (the 🌞 icon) displayed next to the data item container in the Cards section.

DATA ITEMS	
Cards	
Revenue (Sum)	
RevenueTarget (Sum)	
Actual	340
Target	246

This invokes the Card Settings dialog.

On the Layout Options tab, select the required layout type in the Select template list and specify its settings:

ard Settings		×		
Layout Options Delt	a Options Sparkline C	Options Format Options		
Select template:	Min width:	240		
Stretched				
Centered	Max width:	0 📥 🖌 Auto		
Compact	Visible	Value/Element		
Lightweight	Image: A start of the start	Actual Value		
	$\checkmark$	Title		
	$\checkmark$	Subtitle		
	~	Percent Variation		
	~	Absolute Variation		
	~	Delta Indicator		
	$\checkmark$	Sparkline		
	Apply to All Ca	ards Reset		
		OK Cancel Apply		

Min width: Specifies the minimum width of the card content.

**Max width**: Specifies the maximum width of the card content. Use the Auto option to determine the maximum width automatically.

You can show/hide the following values and visual elements within the card:

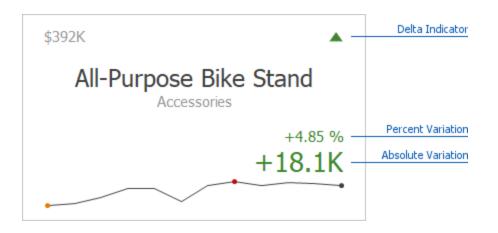

Value	Description	Example
Title	Displays values of the last (bottommost) dimension placed in the Series section.	Microsoft Office Keyboard
Subtitle	Displays combined values of all dimensions except the last (bottommost) dimension.	Technology - Computer Peripherals
Absolute Variation	An absolute difference between the actual and target value.	+1 8 .1 K
Actual Value	A summary value for a measure placed in the Actual placeholder.	\$392K
Card Name	A card name.	Revenue vs . Target

Percent of Target	A percent of a target.	104.85%
Percent Variation	A percent difference between the actual and target value.	4.85%
Target Value	A summary value for a measure placed in the Target placeholder.	\$374K
Dimension {Name}	Allows you to display values of a specific dimension placed in the Series section.	Technology
Element	Description	Example
Delta Indicator	Indicates whether the actual value is less or greater than the target value (see Delta).	•
Sparkline	Visualizes the variation of actual or target values. To learn more, see Sparkline.	

Use the **Apply to All Cards** button to propagate the specified layout settings to all cards corresponding to Actual-Target pairs. The **Reset** button resets all setting to their default values.

## Delta

Cards allow you to visualize the difference between the actual and target values using special delta values and a delta indicator. If the default layout is used (Stretched layout type), the card displays the following delta values/ elements:

- Delta Indicator: Indicates whether the actual value is less or greater than the target value.
- **Percent Variation and Absolute Variation**: Delta values that show a difference between the actual and target value. You can also display the Percent of Target value. To do this, customize the card's layout.

To customize settings that relate to the calculation and display of delta values/elements, use the

Options button (the 🍄 icon) displayed next to the data item container in the Cards section.

DATA ITEMS	
Cards	
Revenue (Sum)	*
RevenueTarget (Sum)	<b>*</b>
Actual	
Target	246

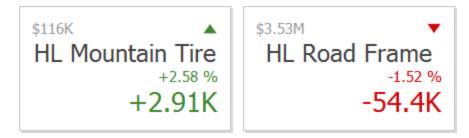

In the invoked Card Settings dialog, go to the Delta Options tab.

Card Settings		×
Layout Options	Delta Options Sparkline Options Format Options	
Result indication:	Greater is good	-
Threshold type:	Percent	-
Threshold value:		0 🔺
	OK Cancel A	pply

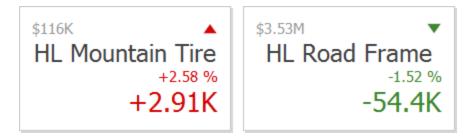

Then, specify the following settings:

Result Indication: You can specify the condition for displaying delta indication.

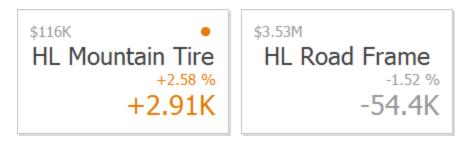

**Greater is Good**: The 'good' indication is displayed if the actual value exceeds the target value; if the target value exceeds the actual value, the 'bad' indication displays.

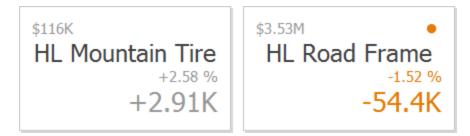

**Less is Good**: The 'bad' indication displays if the actual value exceeds the target value; if the target value exceeds the actual value, the 'good' indication displays.

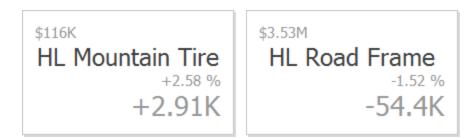

Warning if Greater: A warning is displays only if the actual value exceeds the target value

Warning if Less: A warning is displays only if the target value exceeds the actual value.

No Indication: Indication does not display.

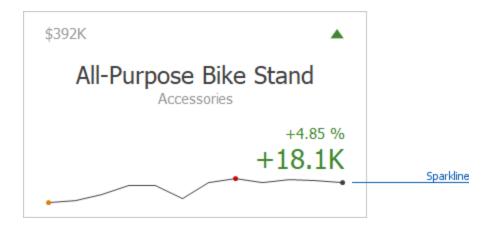

**Threshold type / Threshold value**: For instance, you can specify that a specific indication should display when the actual value exceeds the target value by 1 0 % or by \$ 2 K. Use the Threshold type combo box to select whether you wish to specify the comparison tolerance in percentage values or absolute values.

Then use the Threshold value box to specify the comparison tolerance.

## Sparkline

Sparklines can be used to visualize the variation of actual or target values (for instance, over time).

## **Data Binding Specifics**

You need to provide a date-time or numeric dimension whose data is used as argument values to display a sparkline within the card.

DATA ITEMS		
Cards		
Revenue (Sum)		
RevenueTarget (Sum)	*	
Actual	\$	
Target	246	
Series		
Series		
Sparkline		
CurrentDate (Month)	-	

If you have provided both actual and target values, a sparkline visualizes the actual value's variation.

#### **Change Sparkline Options**

To manage sparkline settings, click the Options button (the 🌞 icon) displayed next to the data item container. In the invoked Card Settings dialog, go to the Sparkline Options tab:

Card Settings	$\times$
Layout Options Delta Options Sparkline Options Format Options	
Sparkline view type: Line	-
✓ Highlight min/max points	
✓ Highlight start/end points	
OK Cancel	Apply
Califer	1,440

The following options are available:

Sparkline Options	Description
Sparkline view type	Defines the sparklines view type. Sparkline data points can be represented as area, line, bars, or win and loss squares.
Highlight min/max points	Specifies whether to highlight the minimum/maximum points of a sparkline.
Highlight start/end points	Specifies whether to highlight the start/end points of a sparkline.

## Formatting

The Card dashboard item formats the actual and target values displayed within cards using format

settings specified for Data Items. Click the options buttons (the sicon) displayed next to the data item container in the Cards section to change format settings for other values.

DATA ITEMS	
Cards	
Revenue (Sum)	*
RevenueTarget (Sum)	*
Actual	34
Target	244

In the invoked Card Settings dialog, go to the Format Options tab and use the Select value type option to specify which values format settings should change.

ard Settings		×
Layout Options Delta Options	Sparkline Options	Format Options
Select value type:	Format type:	Auto
Actual value	Unit:	Auto
Target value	Unit;	
Absolute variation Percent of target	Precision:	2 🔺
Percent variation	Currency:	Use dashboard settings 🔹
	Culture:	Use dashboard settings 🔍
	Include group s	
		\$1.23B (\$1.23B)
		OK Cancel Apply

You can change format settings for the following value types:

- Actual Value
- Target Value
- Absolute Variation
- Percent of Target
- Percent Variation

## Interactivity

This section describes features that enable interaction between the Card dashboard item and other items. These features include Master Filtering and Drill-Down.

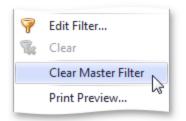

#### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

When Master Filtering is enabled, you can click a card (or multiple cards by holding down the CTRL key) to make other dashboard items only display data related to the selected card(s).

Energy Statistics by Type	Country	Production	Import	Trend
6	Germany	9.7	74.3 🔴	•
Gases	Denmark	7.4	0.1	
-201 -56.26 %	Italy	6.9	61.7	•
• 156	Hungary	2.2	7.9 🔴	
	Austria	1.5	10.2 🔴	
	France	0.6	42.1 🔴	
Petroleum Products	Ireland	0.3	4.4 🔴	· · · · ·
-810 -88.75 %	Czech Republic	0.2	7 🔴	
• 103	Belgium	0	16.8 🔴	••
	Bulgaria	0	2.1 🔴	
	Estonia	0	0.6 🔴	• •
Solid Fuels	Finland	0	3.8 🔴	• •
+28.8 +21.35 %	Greece	0	3.2 🔴	• •
164	Latvia	0	0.9 🔴	••

To reset filtering, use the Clear Master Filter button (the  $\mathbf{T}$  icon) in the caption of the Card dashboard item, or the Clear Master Filter command in the Card's context menu.

#### **Drill-Down**

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly.

When drill-down is enabled, you can click a card to view the details.

When Master Filtering is enabled, you can view the details by double-clicking a card.

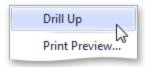

Drill-down requires that the Series section contains several dimensions, from the least to the most detailed dimension.

Series			
Ť	Date (Quarter)		
1	Date (Month)		
Series			

To enable drill-down, click the Drill Down button in the Data Ribbon tab (or the  $\Im$  button if you are using the toolbar menu).

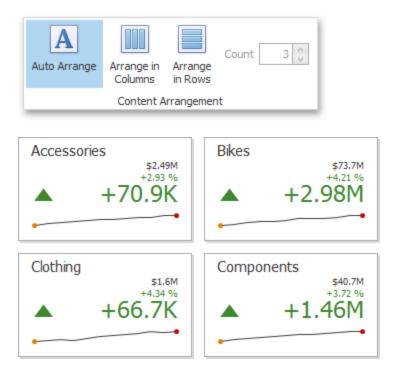

To return to the previous detail level (drill up), use the Drill Up button (the sicon) in the caption of the Card dashboard item, or the Drill Up command in the Card's context menu.

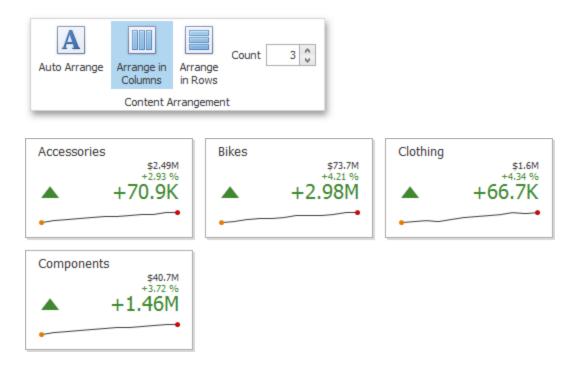

## **Cards Arrangement**

The Card dashboard item allows you to specify the number of columns or rows in which individual cards are arranged.

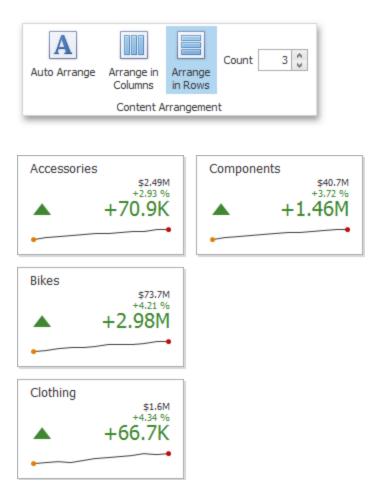

Use the buttons in the Content Arrangement group of the Design Ribbon tab to control how cards are arranged. The Auto Arrange option is enabled by default, which automatically resizes cards to fit within the dashboard item.

You can also specify the number of columns in which cards are arranged. Click the **Arrange in Columns** button and specify the appropriate number in the Count field.

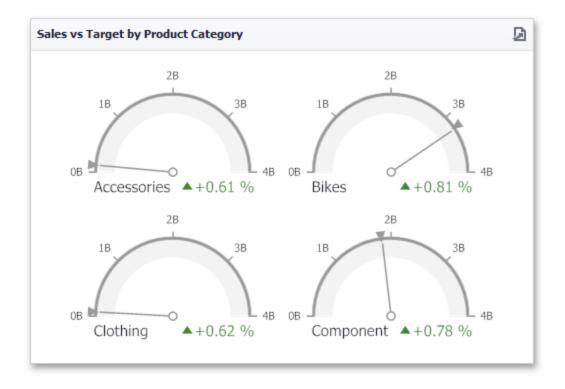

Similarly, you can arrange cards in a specific number of rows.

# Gauges

The Gauge dashboard item displays a series of gauges. Each gauge can communicate two values - one with a needle and the other with a marker on the scale.

The Gauge dashboard item can illustrate the difference for various sets of values. You can switch between these sets using the **Values** button (the S icon) in the dashboard item caption or in the context menu.

## **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Gauge dashboard item to data in the Designer.

The image below shows a sample Gauge dashboard item that is bound to data.

To bind the Gauge dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes Gauge's data sections.

#### **Section Description**

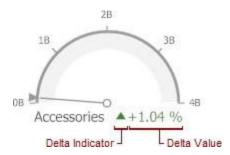

Contains Data Items used to calculate values displayed by gauges. Data Items are arranged in containers. Each data item contain er can hold two Data Items. The first item contains actu al data and the second item (optional) contains target data. If both items are provided, gauges show the difference between actual and target values.

- Gauges You can fill several data item containers in the Gauges section and use the Values drop-down menu to switch between the provided values. To invoke the Values menu, click the icon in the dashboard item caption. This drop- own menu is available if the Series section is not empty. Otherwise, a separate gauge is created for each data item container, and all gauges are displayed simultaneously.
- Series Contains Data Items whose values are used to label gauges.

## Delta

Gauges allow you to display the difference between the actual and target values of a particular parameter. This difference is called delta.

Delta is shown with a delta in dicator (indicating whether the actual value is less than or greater than the target value) and delta values (representing this difference as an absolute value or a variation).

To customize settings that relate to the calculation and display of deltas, use the options buttons

(the 🌞 icon) displayed next to the data item container in the Gauges section of the Data Items pane.

DATA ITEMS	DATA ITEMS
Gauges	Gauges
Sales (Sum)	Sales (Sum)
SalesTarget (Sum)	SalesTarget (Sum)
Actual	Actual
Target	Target

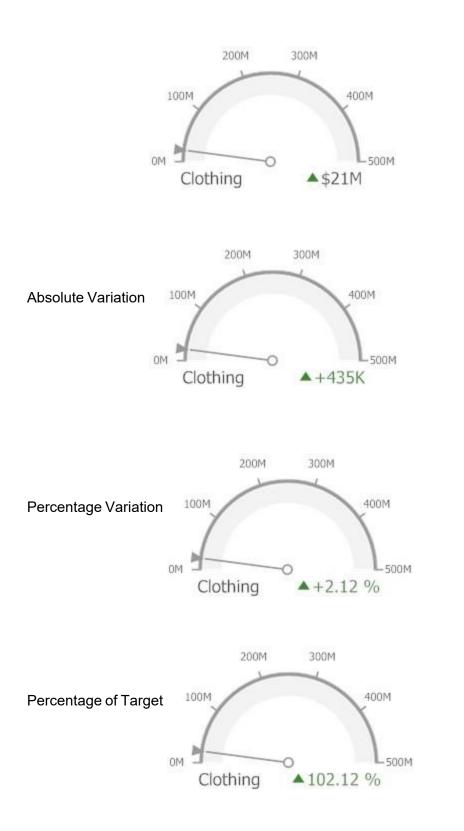

These buttons invoke the Gauge Options dialog.

Use it to define the condition for displaying delta indication, specify which delta values should be displayed, and introduce the comparison tolerance.

## **Delta Values**

You can specify which values should be displayed within gauges. Use the Value type combo box in the Gauge Options window to select the value that will be displayed as the delta value.

Value TypeResultActual Value

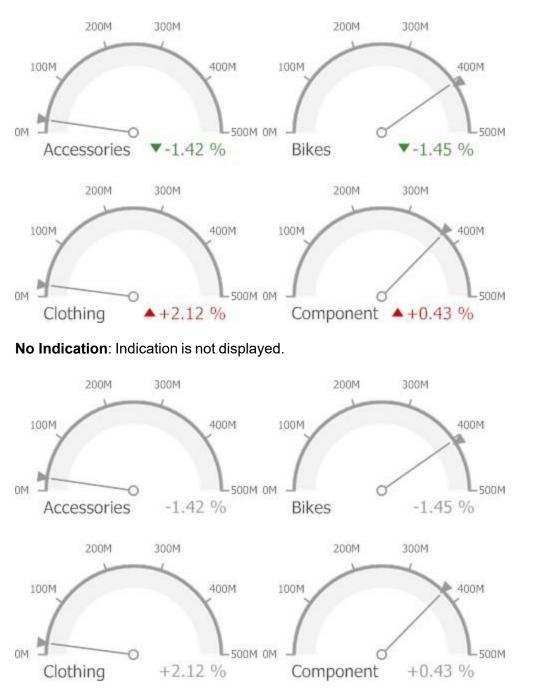

#### **Delta Indication**

You can specify the condition for displaying delta indication. To do this, use the **Result** indication combo box in the Gauge Options window.

**Greater is Good**: The 'good' indication is displayed if the actual value exceeds the target value; if the target value exceeds the actual value, the 'bad' indication is displayed.

**Less is Good**: The 'bad' indication is displayed if the actual value exceeds the target value; if the target value exceeds the actual value, the 'good' indication is displayed.

**Warning if Greater**: A warning is displayed if the actual value exceeds the target value; otherwise, no indication is displayed.

**Warning if Less**: A warning is displayed if the target value exceeds the actual value; otherwise, no indication is displayed.

### **Comparison Tolerance**

The comparison tolerance allows you to create more advanced conditions for displaying delta indication. For instance, you can specify that a specific indication should be displayed when the actual value exceeds the target value by 10 % or by \$ 2K.

Use the Threshold type combo box to select whether you wish to specify the comparison tolerance in percentage values or in absolute values. Then use the Threshold value box to specify the comparison tolerance.

# **Gauge Scale**

By default, the Gauge dashboard item automatically determines the range of the gauge scales based on the values they display.

You can override this behavior and specify the maximum and minimum values on the scale.

To do this, invoke the Gauge Options window using the Options button displayed in the data item container in the Gauges section of the Data Items pane.

D	ATA ITEMS	
G	auges	
	Sales (Sum)	*
	SalesTarget (Sum)	*
	Actual	
	Target	244

In the Gauge Options window, uncheck the Auto check box for the maximum or minimum value, and specify this value in the corresponding field.

Gauge Options	×	
Scale options:		
Minimum value	999 🗘 🗌 Auto	
Maximum value	500000000 🖓 🖌 Auto	
Delta options:		
Value type:	Actual value	
Result indication:	Greater is good 🗸 🗸	
Threshold type:	Percent 🗸	
Threshold value:	0.3	
	OK Cancel	

# Interactivity

This section describes features that enable interaction between the Gauge dashboard item and other items. These features include Master Filtering and Drill-Down.

# **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

When master filtering is enabled, you can click a gauge (or multiple gauges by holding down the CTRL key) to make other dashboard items only display data related to the selected gauge(s).

To reset filtering, use the Clear Master Filter button (the  $\mathbf{\overline{k}}$  icon) in the caption of the Gauge dashboard item, or the Clear Master Filter command in the Gauges context menu.

### **Drill-Down**

The built-in drill-down capability allows you to change the detail level of data displayed in dashboard items on the fly. When drill-down is enabled, you can click a gauge to view the details.

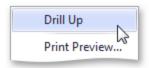

Drill-down requires that the Series section contains several dimensions, from the least detailed to the most detailed dimension.

Series		
Ť	Date (Quarter)	
1	Date (Month)	
	Series	

To enable drill-down, click the Drill Down button in the Data Ribbon tab (or the  $\Im$  button if you are using the toolbar menu).

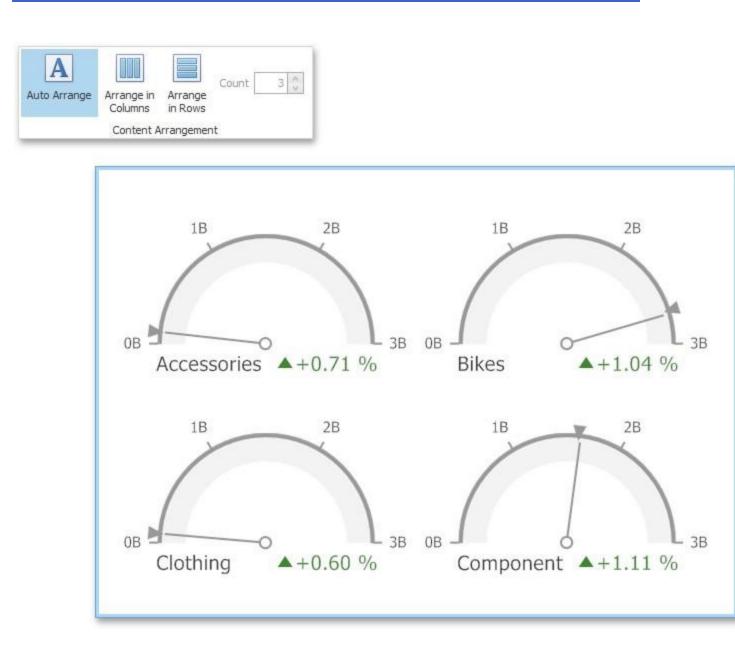

To return to the previous detail level (drill up), use the Drill Up button (the sicon) in the caption of the Gauge dashboard item, or the Drill Up command in the Gauges context menu.

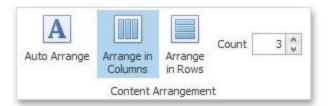

# Layout

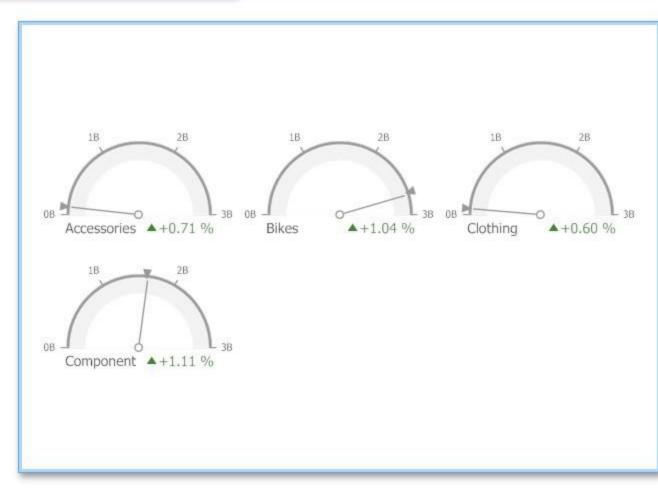

The Gauge dashboard item allows you to specify the number of columns or rows in which individual gauges are arranged.

To control how gauges are arranged, use the buttons in the **Content Arrangement** group of the Design Ribbon tab. By default, the Auto Arrange option is enabled, which automatically resizes gauges to fit within the dashboard item.

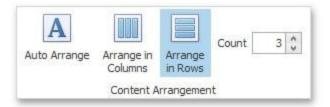

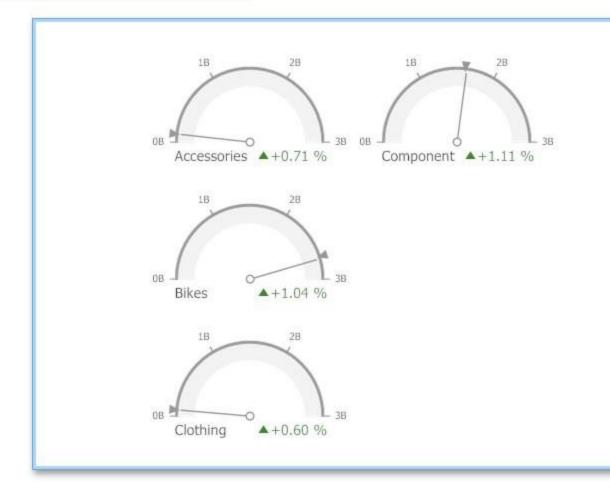

You can also specify the number of columns in which gauges are arranged. Click the **Arrange in Columns** button and specify the appropriate number in the Count field.

Similarly, you can arrange pies in a specific number of rows by clicking the **Arrange in Rows**button.

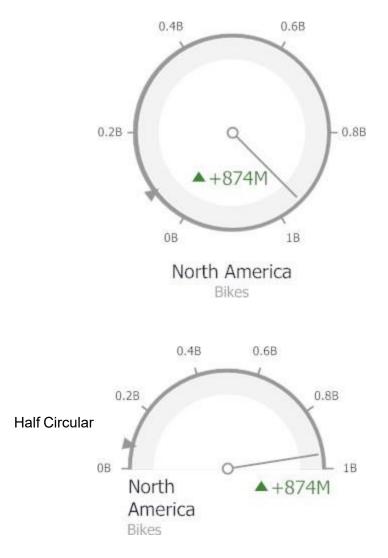

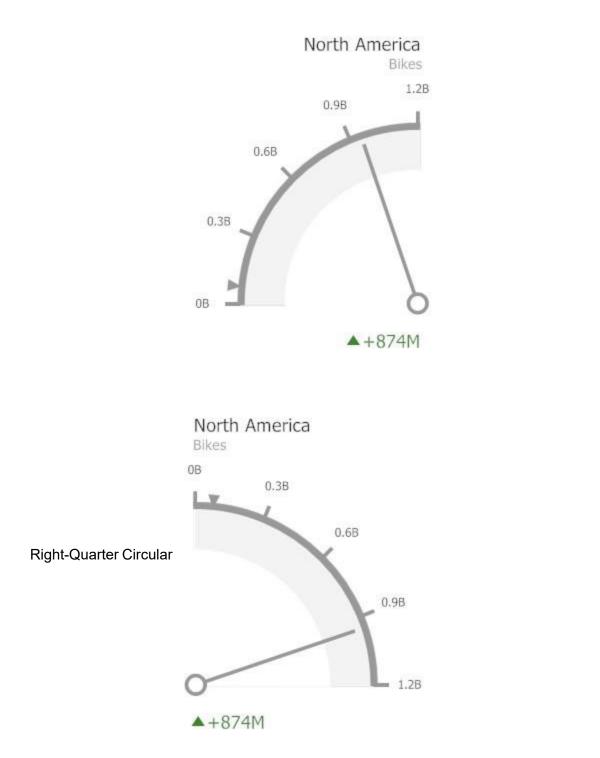

# Style

The Gauge dashboard item allows you to select the gauge type. The following types are supported:

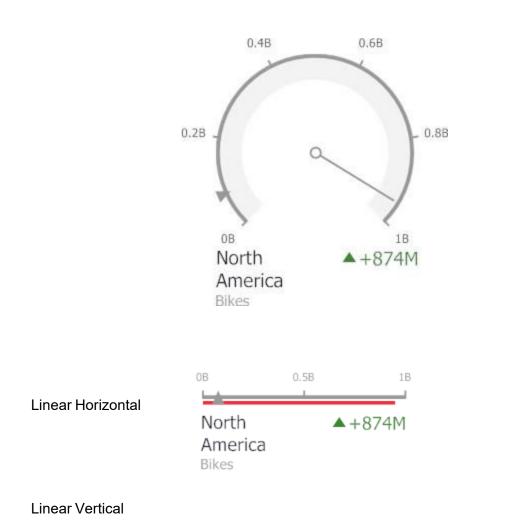

Full Circular

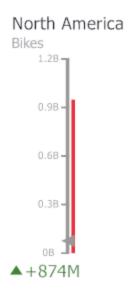

Left-Quarter Circular

Three-Fourths Circular

To select the gauge type, use the buttons in the **Style** group of the Design Ribbon tab.

# Pivot

The Pivot dashboard item displays a cross-tabular report that presents multi-dimensional data in an easy-to-read format.

Sales by State								
	<ul> <li>Accessories</li> </ul>		▶ Bikes		▹ Components		Grand Total

To bind the Pivot dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes a Pivot's data sections.

### Section Description

Values Contains Data Items used to calculate values displayed in the pivot table.

Columns Contains Data Items whose values are used to label columns.

Rows Contains Data Items whose values are used to label rows.

### **Transposing Columns and Rows**

The Pivot dashboard item provides the capability to transpose pivot columns and rows. In this case, Data Items contained in the Columns section are moved to the Rows section and vice versa.

	2013	2014	2015	Grand Total
Bikes	\$72.2M	\$79.3M	\$83.6M	\$235M
Components	\$42.2M	\$45.3M	\$48.2M	\$136M
Accessories	\$2.77M	\$2.99M	\$3.15M	\$8.91M
Grand Total	\$117M	\$128M	\$135M	\$380M

	Bikes	Components	Accessories	Grand Total
2013	\$72.2M	\$42.2M	\$2.77M	\$117M
2014	\$79.3M	\$45.3M	\$2.99M	\$128M
2015	\$83.6M	\$48.2M	\$3.15M	\$135M
Grand Total	\$235M	\$136M	\$8.91M	\$380M

To transpose the selected Pivot dashboard item, use the Transpose button in the Home ribbon tab.

# Interactivity

This document describes the features that enable interaction between the Pivot and other dashboard items. These features include Master Filtering.

# **Master Filtering**

The Dashboard allows you to use any data-aware dashboard item as a filter for other dashboard items (Master Filter).

Data displayed in the Pivot dashboard item can be filtered by other master filter items. You can prevent the pivot from being affected by other master filter items using the **Ignore Master Filters** button on the Data Ribbon tab.

# **Conditional Formatting**

The Pivot dashboard item supports the conditional formatting feature that provides the capability to apply formatting to cells whose values meet the specified condition. This feature allows you to highlight specific cells or entire rows/columns using a predefined set of rules.

# **Conditional Formatting Overview**

The Pivot dashboard item allows you to use conditional formatting to measures placed in the Values section and dimensions placed in the Columns/Rows sections.Note that you can use hidden measures to specify a condition used to apply formatting to visible values.

Note that you can use hidden measures to specify a condition used to apply formatting to visible values.

New appearance settings are applied to pivot data cell or cells corresponding to column/row field values.

# **Create a Format Rule**

To create a new format rule for the Pivot's dimension/measure, do one of the following:

- Click the Options button next to the required measure/dimension, select Add Format Rule and choose the condition. Use the Edit Rules dialog.
- Depending on the selected format condition, the dialog used to create a format rule for Pivot contains different settings. For instance, the image below displays the Greater Than dialog invoked for the measure.

Greater Than ×	
Format Extended Price values that are greater than	
<enter a="" value=""></enter>	
Appearance Icons	
B I U Gr R Y G B	
Custom Appearance	
Intersection mode (Auto)	
Row dimension     Column dimension       [Grand Total]	
Apply to Extended Price	
Apply to row Apply to column	
OK Cancel Apply	

This dialog contains the following settings specific to Pivot.

**Intersection mode** specifies the level on which to apply conditional formatting to pivot cells. The following levels are supported:

• Auto: Identifies the default level. For the Pivot dashboard item, Auto identifies the First Level.

- First Level: First level values are used to apply conditional formatting.
- Last Level: The last level values are used to apply conditional formatting.
- All Levels: All pivot data cells are used to apply conditional formatting.
- **Specific Level**: Values from the specific level are used to apply conditional formatting.

If you specified the Intersection mode as Specific Level, use the Row dimension and Column dimension combo boxes to set the specific level.

The Apply to row and Apply to column check boxes allow you to specify whether to apply the formatting to the entire pivot row/column.

If you are creating a new format rule for the dimension from the Column/Rows section, the corresponding format condition dialog would not contain any Pivot specific settings.

# Edit a Format Rule

To edit format rules for the current Grid dashboard item, use the following options:

- Click the **Edit Rules** button in the Home ribbon tab or use corresponding item in the Pivot context menu. Click the menu button or the required data item and select Edit Rules.
- All of these actions invoke the Edit Rules dialog containing existing format rules.

# Layout

This topic describes how to control the Pivot dashboard item layout, the visibility of totals and grand totals, etc.

### Layout Type

If the Pivot dashboard item contains a hierarchy of dimensions in the Rows section, you can specify the layout used to arrange values corresponding to individual groups.

Layout Type Example

Description

			Grand Total	
			Extended Price (Sum)	Quantity (Sum)
		2015 Total	\$617K	25.5K
		Q1	\$138K	6.3K
Compact		Q2	\$143K	5.71K
I		Q3	\$154K	6.26K
		Q4	\$182K	7.22K
		2016 Total	\$441K	16.2K
		Q1	\$298K	10.6K
		Q2	\$142K	5.6K
	Gra	and Total	\$1.06M	41.7K

**Displays values** from different Row dimensions in a single column. Note that in this case totals are shown at the top of a group, and you cannot change totals position.

			Grand Total		
			Extended Price (Sum)	Quantity (Sum)	
	<b>⊿</b> 2015	Q1	\$138K	6.3K	
		Q2	\$143K	5.71K	Di
Tabular		Q3	\$154K	6.26K	
		Q4	\$182K	7.22K	dir
	2015 Total		\$617K	25.5K	se
	<b>⊿</b> 2016	Q1	\$298K	10.6K

		Q3	\$154K	Quantity (Su
		Q4	\$182K	
	a 2016	Q1	\$298K	
		Q2	\$142K	
	Grand Total		\$1.06M	

To manage the visibility of totals and grand totals, use the Totals and Grand Totals buttons in the Design ribbon tab, respectively.

These buttons invoke a popup menu that allows you to manage the visibility of column and row totals/grand totals separately.

Moreover, you can control the visibility of totals for individual dimensions/measures by using the data item's context menu (Show Totals and Show Grand Totals options).

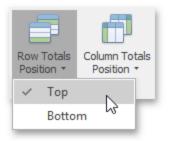

### **Totals Position**

If necessary, you can change the Pivot dashboard items totals/grand totals position. For instance, in the image below the row totals are moved from the bottom to the top.

		Grand Total	
		Extended Price (Sum)	Quantity (Sum)
# 2015	Q1	\$138K	6.3K
	Q2.	\$143K	5.71K
	Q3	\$154K	6.26K
	Q4	\$182K	7,22K
2015 Total		\$617K	25.5K
a 2016	Q1	\$298K	10.6K
	Q2	\$142K	5,6K
2016 Total		\$441K	16.2K
Grand Total		\$1.06M	41.7K

		Grand Total	
		Extended Price (Sum)	Quantity (Su
Grand Total		\$1.06M	
# 2015 Tota	al	\$617K	
2015	Q1	\$138K	
	Q2	\$143K	
	Q3	\$154K	
	Q4	\$182K	
# 2016 Total		\$441K	
2016	Q1	\$298K	
	Q2	\$142K	

To manage totals position, use the **Row Totals Position** and **Column Totals Position** buttons in the Design ribbon tab.

# Values Visibility

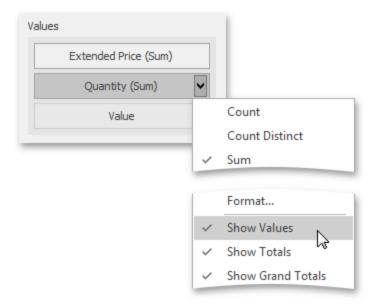

The Pivot dashboard item can contain several measures in the Values section to hide summary values corresponding to specific measures. For instance, the image below shows the Pivot with hidden Quantity values.

		UK		USA	
		Extended Price (Sum)	Quantity (Sum)	Extended Price (Sum)	Quantity (Sum)
⊿ 2015	Q1	\$27.8K	1.24K	\$110K	5.06K
	Q2	\$38.1K	1.65K	\$105K	4.06K
	Q3	\$53.3K	1.86K	\$101K	4.4K
	Q4	\$41.3K	1.71K	\$140K	5.51K
<b>⊿</b> 2016	Q1	\$79.1K	3.04K	\$219K	7.6K
	Q2	\$44.7K	1.59K	\$97.4K	4.01K

		UK	USA
▲ 2015	Q1	\$27.8K	\$110K
	Q2	\$38.1K	\$105K
	Q3	\$53.3K	\$101K
	Q4	\$41.3K	\$140K
<b>⊿</b> 2016	Q1	\$79.1K	\$219K
	Q2	\$44.7K	\$97.4K

To do this, use the Show Values command in the measure menu.

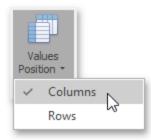

# Values Position

The Pivot dashboard item allows you to control the position of headers used to arrange summary values corresponding to different measures. For instance, you can display values in columns or rows.

		Grand Total	Grand Total					Grand Total	
		Extended Price (Sum)	Quantity (Sum)		a 2016	Q1	Extended Price (Sum)		
# 2016	Q1	\$298K	10.6K	10.6K	>			Quantity (Sum)	
	Q2	\$142K	5.6K			Q2	Extended Price (Sum)		
2016 Total		\$441K	16.2K				Quantity (Sum)		
Grand Total		\$441K	16.2K		2016 Total		Extended Price (Sum)		
							Quantity (Sum)		
					Grand Total	Grand Total	Extended Price (Sum)		
							Quantity (Sum)		

To manage this position, use the Values Position button in the Design ribbon tab.

# **Rest Layout Options**

To reset layout options, click the Reset Layout Options button in the Design ribbon tab.

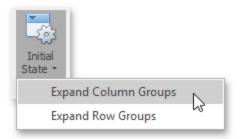

# **Expanded State**

If the Columns and Rows section contains several Data Items, the Pivot column and row headers are arranged in a hierarchy and make up column and row groups.

		UK	USA	Grand Total
	2016 Total	\$124K	\$317K	\$441K
	₄ Q1 Total	\$79.1K	\$219K	\$298K
	January	\$25.5K	\$68.7K	\$94.2K
	February	\$32.9K	\$66.6K	\$99 <b>.4</b> K
	March	\$20.7K	\$84.2K	\$105K
	▶ Q2	\$44.7K	\$97.4K	\$142K
Gra	and Total	\$124K	\$317K	\$441K

You can collapse and expand row and column groups using the arrow buttons. However, the current expanded state of column and row groups do not save in the dashboard definition. If necessary, you can specify the default expanded state using the **Initial State** button in the Design ribbon tab.

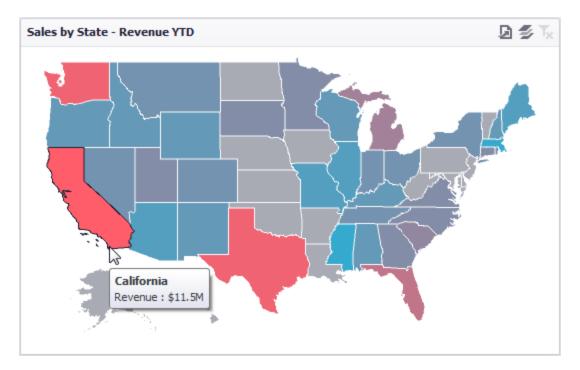

This button invokes the pop-up menu that allows you to select whether column and row groups should be collapsed or expanded by default.

# **Choropleth Map**

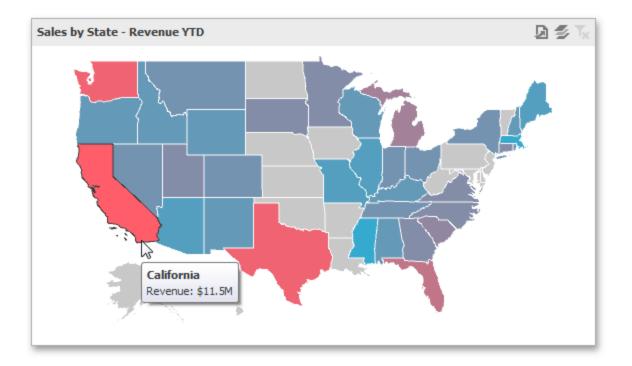

The topics in this section describe the features available in the Choropleth Map dashboard item.

The Choropleth Map dashboard item allows you to colorize the required areas in proportion to the provided values.

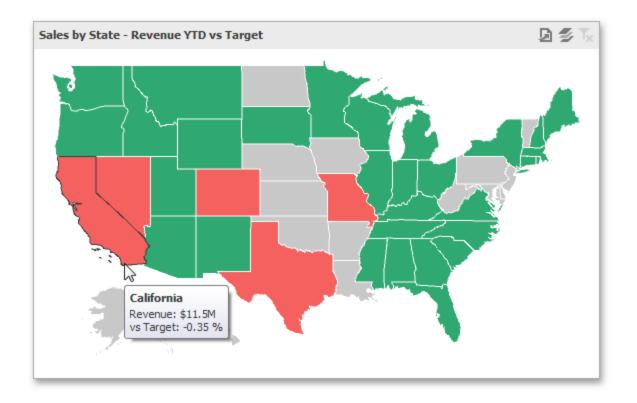

The Chloropleth Map dashboard item colorizes map areas in the following two ways:

• Based on the values provided.

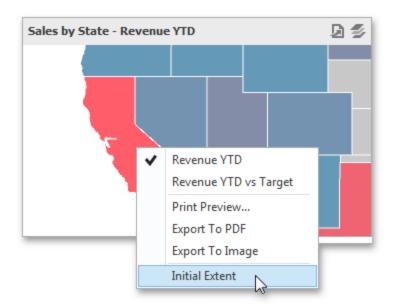

• By indicating the difference between the actual and target values of a particular parameter.

You can switch between the provided values using the Values button (the sicon) in the map's caption area, or by using the context menu.

You can use the mouse wheel to change the current zoom level for the map. To scroll the map, hold down the left mouse button and drag it.

To move to the initial zooming and scrolling state, select the Initial Extent menu item in the map's context menu.

The Choropleth Map dashboard item can display a tooltip that shows information on a hovered area.

# **Providing Maps**

This document explains how to use the default BI Dashboard maps, or provide custom maps.

# **Default Maps**

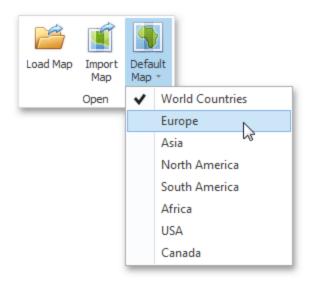

The BI Dashboard ships with a set of default maps showing various parts of the world. The following maps are included:

- World Countries: A world map
- Europe

- Asia
- North America:
- South America
- Africa
- USA
- Canada

Note that the World Countries map has a lower level of detail than maps of specific regions and may not contain some countries. As an alternative, you can load a custom map with the required granularity.

To select the required default map, use the **Default Map** button in the Open group of the Design ribbon tab.

As an alternative, use the corresponding command in the map context menu.

### **Custom Maps**

A Shapefile vector format to provide custom maps. Commonly, this format includes two file types:

- .shp file holds map shapes(points/lines/polygons).
- .dbf file contains attributes for each shape.

To open an existing shapefile, use the Load Map or Import Map button in the Ribbon, or the command in the context menu (Load Map or Import Map).

In the invoked dialog, locate the required .shp file. Note that custom maps created in the Cartesian coordinate system are not supported.

If the map is opened using the Load Map button, the dashboard XML definition will contain the path to a map shapefile. If the map is opened using the Import Map button, the dashboard XML definition will contain the map itself.

### **Map Attributes**

After you select the default map or a custom map, you can view supplemental information (such as the name of the country, state, etc.). To do this, click the Options button next to the Attribute placeholder.

Attribute	
Map Attribute Binding	X
Bind a data member to:	ab NAME
	OK Cancel

In the invoked Map Attribute Binding dialog, click **Preview**.

NAME	NAME_ALT	ADM1_CODE
Hawaii	HI Hawaii	USA-3517 ^
Alaska	AK Alaska	USA-3563
Alabama	AL Ala.	USA-3541
Arkansas	AR Ark.	USA-3528
Arizona	AZ Ariz.	USA-3520
California	CA Calif.	USA-3521
Colorado	CO Colo.	USA-3522
Connecticut	CT Conn.	USA-3537 🗸
<		>
	Ok	Close

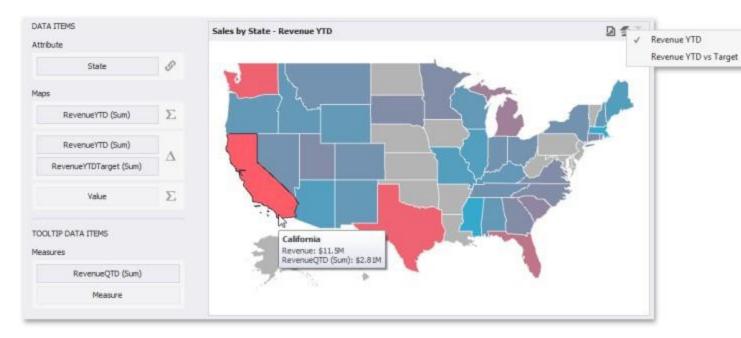

This table displays the available attributes for the current map. Each set of attribute values is related to a specific map shape.

# **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Choropleth Map dashboard item to data in the Designer.

The image below shows a sample Choropleth Map dashboard item that is bound to data.

To bind the Choropleth Map dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. The Choropleth Map provides two data item groups for data binding: Data Items and TOOLTIP Data Items. Tables below list the available data sections.

# Data Items

Attribute: Allows you to associate map shapes with data source field values.

Map Attribute Binding		×
Bind a data member to:	ab NAME	D
	ab ISO_3166_2	1
	ab CODE_LOCAL	ЬI
	ab CODE_HASC	
	ab REGION	
	ab REGION_BIG	
	ab ABBREV	
	ab POSTAL	-

To associate map shapes with data source field values, drag-and-drop the required dimension to the data item's placeholder and select the required attribute in the Map Attribute Binding dialog.

To invoke this dialog, click the **Options** button (the 🛃 icon) next to the Attribute placeholder.

Select the required attribute and click **OK**.

**Maps**: Contains Data Items whose values are used to color map shapes. Map shape colors vary based on the map type.

Click the Options button (the  $\Sigma$  or  $\Delta$  icon depending on the map type) next to the Value placeholder and select the required map type in the invoked Choropleth Map Options dialog.

Choropleth Map Options		
Map type:		
Value		
🔿 Delta		

• If you select Value, the Choropleth map colors map shapes depending on the values provided.

• If you select Delta, the Choropleth map colors map shapes depending on the difference between two values. To learn how to specify delta indication settings, see Delta.

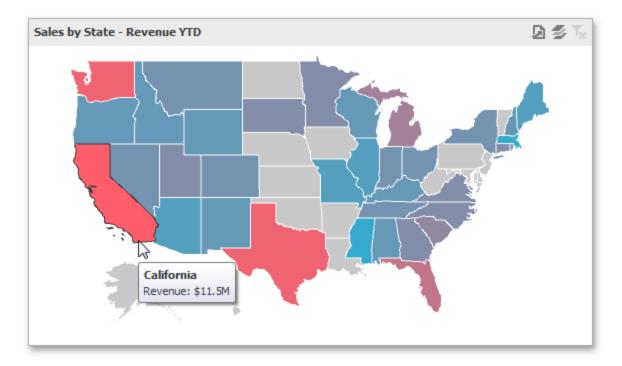

You can fill several data item containers in the Maps section and use the Values drop-down menu to switch between the provided values. To invoke the Values menu, click the icon in the dashboard item caption.

# **Tooltip Data Items**

Measures : Allows you to add supplementary content to the tooltips. Drag and drop the required measures to provide additional data.

# **Map Coloring**

The Choropleth Map dashboard item colors map shapes depending on the data provided. For instance, you can visualize a sales amount or population density.

### **Palette and Scale Settings**

The Choropleth Map automatically selects palette and scale settings to color map shapes.

If you need to customize these settings, click the Options button next to the data item that contains these values.

DATA	ITEMS	
Attrib	ute	
Ť	State	G
Maps		
	RevenueYTD (Sum)	Σ

This invokes the Choropleth Map Options dialog

Map type:	Color palette	Pre	eview		
Value	<ul> <li>Auto</li> </ul>	E	Allow Edit		
🔿 Delta	Custom		Range stop	Color	
	Start color 54, 170, 20	5 4	90	54, 170, 206	
	End color 255, 93, 10		80	76, 162, 195	
			70	98, 153, 184	
	Scale settings		60	121, 145, 173	
			50	143, 136, 162	
	Percent scale		40	165, 128, 151	
	Number of levels: 1	0 0	30	188, 119, 140	
	Absolute scale		20	210, 111, 129	
	Number of levels: 1	0 0		232, 102, 118	~
		+	- 1 × <		>

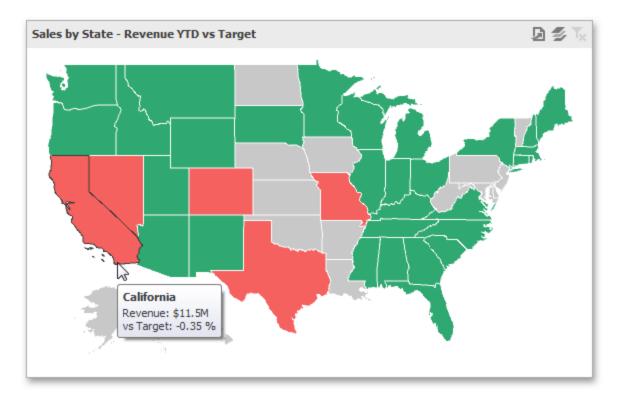

You can specify the following settings in this window:

- Color palette: Allows you to specify the start and end color of the palette.
- **Scale settings**: Specifies whether a percent scale or an absolute scale is used to define a set of colors. You can specify the number of levels that represent the number of colors used to color the map.
- **Preview**: Used to display a full set of palette colors generated based on the start/end colors and the number of levels. Use the Allow Edit check box to automatically change the generated colors or specify value ranges for each color.

Also, the Choropleth Map allows you to visualize the difference between the actual and target values of a particular parameter.

# Delta

The Choropleth Map allows you to indicate the difference between the actual and target values of a particular parameter. This difference is called delta.

### **Delta Options**

To specify delta indication settings, click the Options button next to the data item container.

DATA IT	EMS	
Attribut	e	
Ť	State	0
Maps		
	RevenueYTD (Sum)	
Re	venueYTDTarget (Sum)	

This invokes the Choropleth Map Options dialog. When the map type is set to Delta, this dialog contains the following settings.

Choropleth Map Options		x
Map type: Value Delta	Delta Options         Value type:       Actual value         Result indication:       Greater is good         Threshold type:       Percent         Threshold value:	
	OK Cancel	Apply

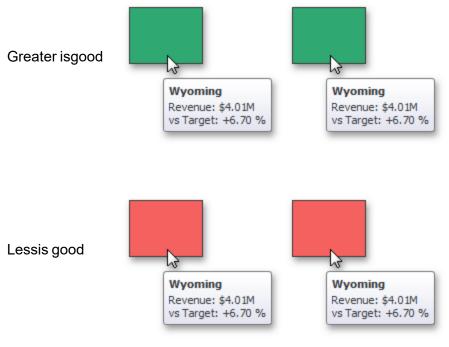

**Value Type**: You can specify which values to display within map tooltips. Use the Value type combo box to select the value that will be displayed as the delta value.

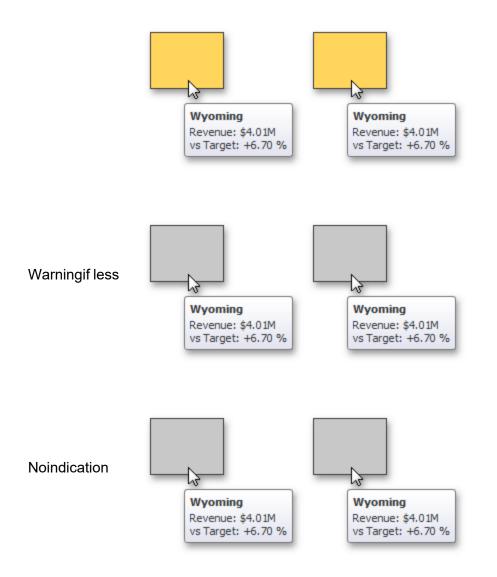

#### **Result Indication**

You can specify the condition that will be used to select the indicator color. To do this, use the Result indication combo box.

Warningif greater

### **Threshold Type and Threshold Value**

You can specify that a required indicator should only be displayed when the difference between the actual and target values exceeds a specified value. For instance, the actual value exceeds the target value by 10%, or by \$2K.

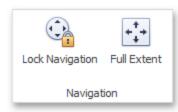

Use the Threshold type combo box to select whether you wish to specify the threshold in percentage values or in absolute values. Then use the Threshold value box to specify the threshold value.

# **Map Navigation**

The Choropleth Map dashboard item allows you to perform navigation actions such as zooming and scrolling.

The Dashboard Designer allows you to specify the initial zooming/scrolling state for the Choropleth map using the mouse.

You can disable the capability to scroll/zoom the map using the **Lock Navigation** button in the Design ribbon tab.

Use the Full Extent button to display the entire map within the dashboard item.

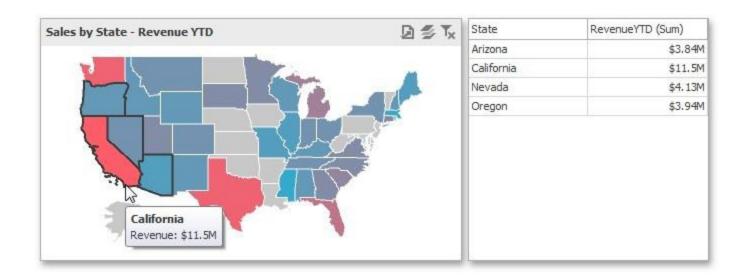

# Interactivity

This document describes the Master Filtering feature, which enables interaction between the Choropleth Map and other dashboard items.

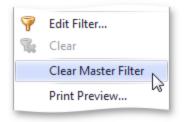

### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

When Master Filtering is enabled, you can click a shape (or multiple shapes by holding down the CTRL key) to make other dashboard items only display data related to the selected shape(s).

To reset filtering, use the Clear Master Filter button (the  $\mathbf{\overline{k}}$  icon) in the map's caption, or the **Clear Master Filter** command in the map's context menu.

# Labels

A Choropleth map provides the capability to display titles within map shapes and allows you to manage what data to show in the shape tooltips.

To manage map titles and tooltips, click the Shape Labels button in the Design ribbon tab.

This invokes the Shape Label Settings dialog.

Shape Label Settings	×
Title attibute:	NONE V P
	Include summary value
Tooltip attribute:	Use binding attribute    ✓ P
	OK Cancel

In this dialog, you can specify attributes whose values will be displayed within shapes and tooltips. Use the magnifying glass button to preview the available attributes and their values for the current map.

#### **Shape Tiles**

The Title attribute option allows you to select the attribute whose values are displayed within corresponding map shapes.

Shape Label Settings	i i	×		Wash \$7,93M	font. Minr	in the second se
Title attibute:	ABBREV	V P	_	Ore. \$3.94M	Wyo, \$4.01M	N.Y.
	$\fbox$ Include summary value				Colos \$4:14M	( Los
Tooltip attribute:	Use binding attribute	¥ 12		Calif. \$11.5M		
				-	Tex. \$7.88M	Fla. \$5.04M
	ОК	Cancel		100		

You can also use the Include summary value option to add summary values to shape titles.

#### **Tooltips**

The Choropleth Map dashboard item displays a tooltip that shows information related to a hovered shape.

You can choose whether to use a binding attribute to display as the title of shape tooltips (the Use binding attribute option) or specify a custom attribute using the Tooltip attribute option.

Tooltip attribute:	Use binding attribute		✓
	Use binding attribute		^
	ab NAME		
	ab NAME_ALT		
	ab ADM1_CODE	5	el
	123 DISS_ME		
	ab ISO_3166_2		
	DODE_LOCAL		~

The Choropleth Map also allows you to add supplementary content to the tooltips using the Tooltip Data Items area.

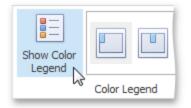

# Legend

A legend is an element of a map that shows values corresponding to each color.

\$3.59M	\$5.17M	\$6.75M	\$8.33M	\$9.91M

#### Visibility

To display a legend within a map, use the Show Legend button in the Legend group of the Design Ribbon tab.

### **Position and Orientation**

To specify the legend's position and orientation, select one of the predefined options from the gallery in the Design Ribbon tab.

Vertical		$^{\circ}$
Horizon	tal	
	d III	~

# **Geo Point Maps**

The topics in this section describe various types of Geo Point Map dashboard items that allow you to place callouts, bubbles or pies on the map using geographical coordinates.

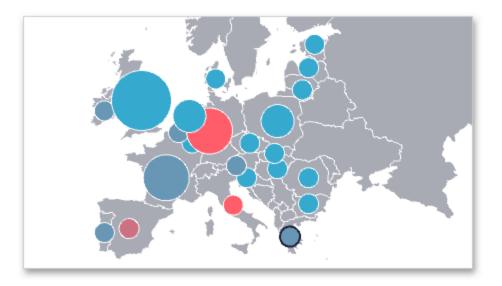

The dashboard supports three types of Geo Point maps:

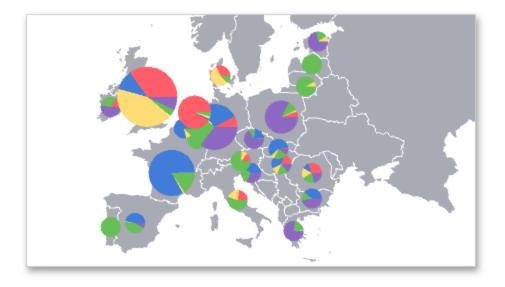

• The Geo Point Map dashboard item allows you to place callouts on the map using geographical coordinates.

• The Bubble Map dashboard item allows you to place bubbles on the map. Each bubble can represent data via its weight and color.

• The Pie Map dashboard item allows you to display pies on the map. Each pie visualizes the contribution of each value to the total.

# **Map Zooming and Scrolling**

You can use the mouse wheel to change the current zoom level for a map. To scroll the map, hold down the left mouse button and drag it.

To move to the initial zooming and scrolling state, click the Initial Extent menu item in the map's context menu.

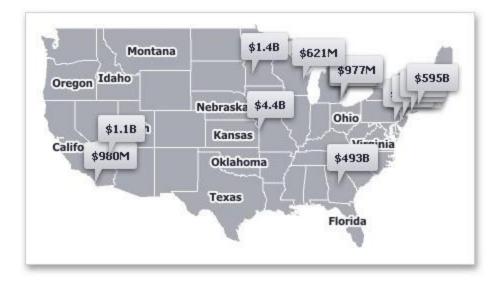

A Geo Point Map dashboard item can display a tooltip that shows information on a hovered callout/bubble/pie.

France
Production (Size): 128
Shortage (Color): 25.9
Consumption: 154

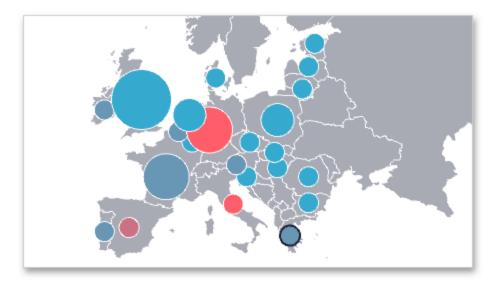

# Map Types Overview

The Dashboard Designer allows you to create three types of Geo Point maps.

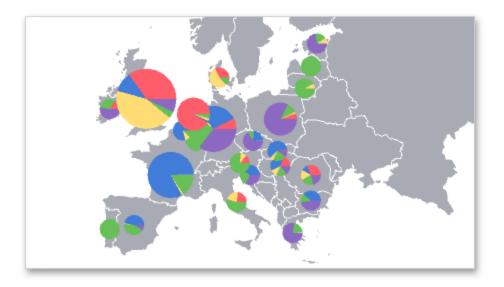

The Geo Point Map dashboard item allows you to place callouts on the map using geographical coordinates.

The Bubble Map dashboard item allows you to place bubbles on the map. Each bubble can represent data using its weight and color.

The Pie Map dashboard item allows you to display pies on the map. Each pie visualizes the contribution of each value to the total.

To create the required Geo Point Map dashboard item, use the Geo Point Maps button in the Home ribbon tab.

# **Providing Maps**

This document explains how to use the BI Dashboard maps or provide custom maps.

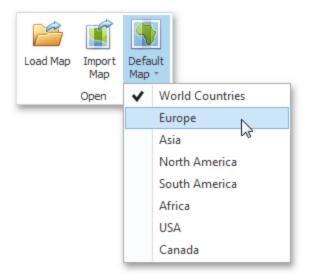

### **Default Maps**

The BI Dashboard contains a set of default maps showing various parts of the world. The following maps are included:

- World Countries
- Europe
- Asia
- North America
- South America
- Africa
- USA
- Canada

Note that the World Countries map has a lower level of detail than maps of specific regions and may not contain some countries. As an alternative, you can load a custom map with the required granularity.

To select the default map, use the **Default Map** button in the Design ribbon tab.

As an alternative, use the corresponding command in the map's context menu.

#### **Custom Maps**

A **Shapefile vector** format to provide custom maps. Commonly, this format includes two file types:

- .shp file holds map shapes (points/lines/polygons).
- .dbf file contains attributes for each shape.

To open an existing shapefile, use the **Load Map** or **Import Map** button in the Ribbon, or the command in the context menu.

If the map is opened using the Load Map button, the dashboard XML definition will contain the path to a map shapefile. If the map is opened using the Import Map button, the dashboard XML definition will contain the map itself.

# **Geo Point Map**

The Geo Point Map dashboard item allows you to place callouts on the map using geographical coordinates.

# **Providing Data**

This topic describes how to bind the Geo Point Map dashboard item to data using the Dashboard Designer.

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner. The only difference is in the data sections that these dashboard items have.

The image below shows a sample Geo Point Map dashboard item that is bound to data.

DATA ITEMS	
Latitude	
Latitude	124 56.5 56.4
Longitude	108 20.9
Longitude	The cost
Value	106
Production	

Note that the Geo Point Map provides two data item groups for data binding: Data Items and TOOLTIP Data Items. Tables below list the available data sections.

#### **Data Items**

#### Section Description

Latitude Accepts a dimension used to provide geographic latitude.

- Longitude Accepts a dimension used to provide geographic longitude.
- Value Accepts values related to geographic points. These values are displayed within map callouts.

### **Tooltip Data Items**

#### Section Description

Dimensions Accepts dimensions allowing you to add supplementary content to the tooltips. Measures Accepts measures allowing you to add summaries to the tooltips.

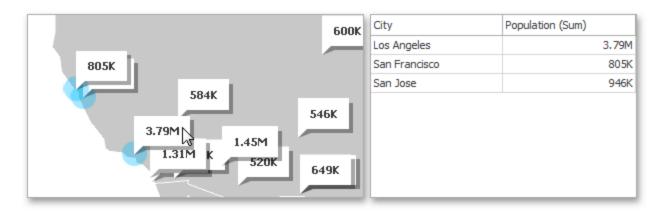

# Interactivity

This document describes the capabilities that enable interaction between Geo Point maps and other dashboard items. These capabilities include Master Filtering.

### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

When Master Filtering is enabled, you can click a callout/bubble/pie (or multiple callouts/bubbles/pies by holding down the CTRL key) to make other dashboard items only display data related to the selected callout(s)/bubble(s)/ pie(s).

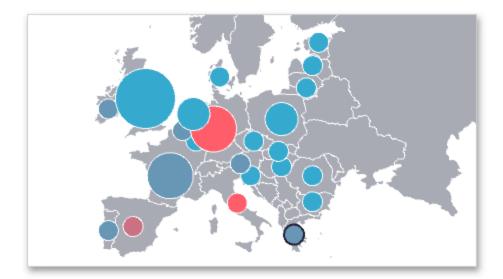

You can also select multiple callouts/bubbles/pies in the following way.

- Hold the Shift key and the left mouse button
- Drag the mouse pointer, to mark an area that includes the desired elements
- Release the left mouse button. All elements within the area will be selected

To reset filtering, use the Clear Master Filter button (the **T** icon) in the Map's caption area, or the Clear Master Filter command in the context menu.

# **Bubble Map**

The Bubble Map dashboard item allows you to place bubbles on the map. Each bubble can represent data using its weight and color.

# **Providing Data**

This topic describes how to bind the Bubble Map dashboard item to data using the Dashboard Designer.

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner. The only difference is in the data sections that these dashboard items have.

The image below shows a sample Bubble Map dashboard item that is bound to data.

DATA ITEMS	
Latitude	
Latitude	
Longitude	
Longitude	
Weight	- And Inder
Production	
Color	
Import (Sum)	

Note that the Bubble Map provides two data item groups for data binding: Data Items and TOOLTIP Data Items. Tables below list the available data sections.

#### **Data Items**

The Bubble Map dashboard item automatically selects palette and scale settings used to color bubbles. To customize these settings, click the **Options** button next to the Color placeholder. This invokes the Color Scale Options dialog, which allows you to specify the palette and scale options.

Latitude: Accepts a dimension used to provide geographic latitude.

Longitude: Accepts a dimension used to provide geographic longitude.

Weight: Accepts a measure used to evaluate the bubble's weight.

Color: Accepts a measure used to evaluate the bubble's color.

### **Tooltip Data Items**

Dimensions: Accepts dimensions allowing you to add supplementary content to the tooltips.

Measures: Accepts measures allowing you to add summaries to the tooltips.

# Coloring

The Bubble Map dashboard item automatically selects palette and scale settings used to color bubbles depending on the provided values.

DATA ITEMS	
Latitude	
Latitude	
Longitude	
Longitude	
Weight	a free from the second
Production	
Color	
Import (Sum)	

To customize these settings, click the **Options** button next to the Color placeholder. This invokes the Color Scale Options dialog, which allows you to specify the palette and scale options.

Color Scale Options	×
- Color palette	Preview
<ul> <li>Auto</li> </ul>	Allow Edit
◯ Custom	Range stop Color
Start color 54, 170, 206 -	▶ 0 54, 170, 206
End color 255, 93, 106 -	20 104, 151, 181
	40 154, 132, 156
Scale settings	60 🗾 204, 113, 131
	80 💶 255, 93, 106
Percent scale	
Number of levels: 5	
O Absolute scale	
Number of levels: 10	
	$+ - \checkmark \mathbf{x} < >$
	OK Cancel Apply

You can specify the following settings in this window:

Color palette: Allows you to specify the start and end color of the palette

**Scale setting**: Specifies whether a percent scale or an absolute scale is used to define a set of colors. You can specify the number of levels that represent the number of colors used to color the map.

**Preview**: Used to display a full set of palette colors generated based on the start/end colors and the number of levels. Use the **Allow Edit** check box to automatically change the generated colors or specify value ranges for each color.

### Legends

Bubble Map provides two types of legends used to identify map objects - color and weighted legends.

#### **Color Legend**

The color legend helps you to identify which colors correspond to specific values.

\$3.59M	\$5.17M	\$6.75M	\$8.33M	\$9.91M

To display a color legend within a map, use the Show Color Legend button in the Color Legend section of the Design Ribbon tab.

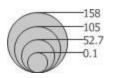

To specify the legend's position and orientation, select one of the predefined options from the gallery in the Design Ribbon tab.

Vertical		$^{\circ}$
Horizon	tal	
	d	~

### Weighted Legend

The weighted legend allows you to identify values corresponding to specific bubble sizes.

To select the required weighted legend type, use the Show Weighted Legend button in the Weighted Legend section of the Design Ribbon tab.

	v Weighted		
	None	Legend	
ô-	Linear		
0:	Nested	45	

To specify the legend's position, select one of the predefined options from the gallery in the Design Ribbon tab.

Position	^
	~

# Pie Map

The Pie Map dashboard item allows you to display pies on the map. Each pie visualizes the contribution of each value to the total.

# **Providing Data**

This topic describes how to bind the Pie Map dashboard item to data using the Dashboard Designer.

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner. The only difference is in the data sections that these dashboard items have.

The image below shows a sample Pie Map dashboard item that is bound to data.

Note that the Pie Map provides two data item groups for data binding: Data Items and Tooltip Data Items. Tables below list the available data sections.

#### **Data Items**

Latitude Accepts a dimension used to provide geographic latitude.

Longitude Accepts a dimension used to provide geographic longitude.

Accepts measures used to calculate pie values. In case of negative measure values, Pie Map uses their absolute values. If you added a data item to the Argument section

Values and several Data Items to the Values section, you can use the Values drop-down menu to switch between the provided values. To invoke the Values menu, click the icon in the map's caption or use the map's context menu.

Argument Allows you to provide data for pie arguments.

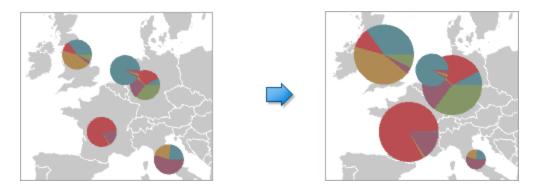

#### **Tooltip Data Items**

#### Section Description

Dimensions Accepts dimensions allowing you to add supplementary content to the tooltips. Measures Accepts measures allowing you to add summaries to the tooltips.

# **Pie Options**

The Pie Map dashboard item allows you to take into account the weight of pies. In this case, the relative sizes of the pies depend on the corresponding summary values.

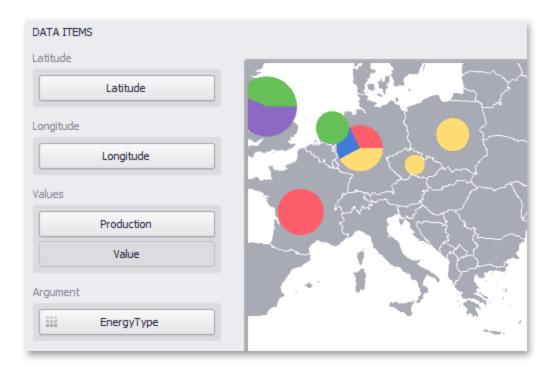

To enable this capability, use the Weighted Pies button in the Design ribbon tab.

# Coloring

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

The Pie Map dashboard item allows you to manage the coloring of segments corresponding to various dimension values/measures. For instance, the image below illustrates the Pie Map dashboard item whose argument values are colored by hue.

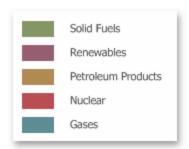

# Legends

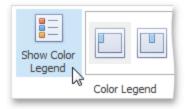

The Pie Map provides two types of legends used to identify map objects - color and weighted legends.

### **Color Legend**

The color legend helps you to identify which colors correspond to specific argument values.

To display a color legend within a map, use the **Show Color Legend** button in the Color Legend section of the Design Ribbon tab.

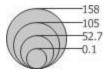

To specify the legend's position and orientation, select one of the predefined options from the gallery in the Design Ribbon tab.

Vertical		
Horizon	tal	
	d	~

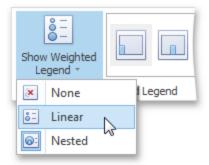

### Weighted Legend

The weighted legend allows you to identify values corresponding to specific pie sizes.

The Pie Map dashboard item does not display the weighted legend if weighed pies are disabled.

To select the required weighted legend type, use the Show Weighted Legend button in the Weighted Legend section of the Design Ribbon tab.

To specify the legend's position, select one of the predefined options from the gallery in the Design Ribbon tab.

Position	^
	~

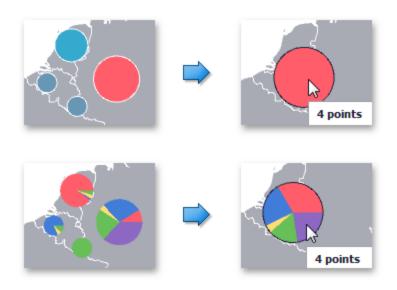

# Clustering

When a Geo Point map contains a large number of objects (callouts, bubbles or pies), showing each object individually on the map is not useful. The Dashboard Designer provides the capability to group neighboring map objects. This feature is called Clustering.

For instance, the Geo Point Map dashboard item combines callouts to bubbles.

The Bubble Map and Pie Map dashboard items cluster bubbles/pies with other bubbles/pies.

To enable clustering in the Designer, use the Enable Clustering button in the Data ribbon tab.

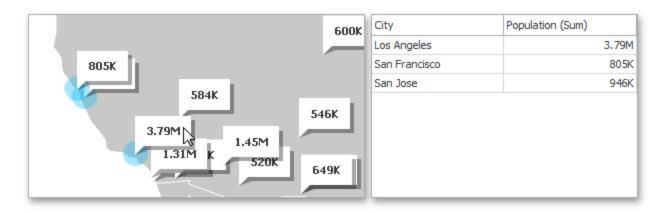

# Interactivity

This document describes the Master Filtering capability, which enables interaction between the Geo Point Map and other dashboard items.

### **Master Filtering**

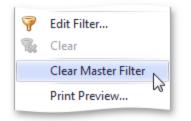

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

When Master Filtering is enabled, you can click a callout/bubble/pie (or multiple callouts/bubbles/pies by holding down the CTRL key) to make other dashboard items only display data related to the selected callout(s)/bubble(s)/ pie(s).

When you select a clustered bubble or pie, master filtering is applied by all points that are clustered into this bubble/pie.

To reset filtering, use the **Clear Master Filter button** in the map's caption, or the Clear Master Filter command in the context menu.

# Labels

Geo Point maps provide the capability to display titles within map shapes and allows you to add supplementary content to the callout/bubble/pie tooltips.

### Shape Tiles

To manage map titles, click the **Shape Title** button in the Design ribbon tab.

Shape Title	
Lab	

This invokes the Shape Title Settings dialog.

Shape Title Setting	gs	×
Title attibute:	NONE	Q
	OK	

In this dialog, you can specify attributes whose values will be displayed within shapes. Use the *P* button to preview the available attributes and their values for the current map.

The Title attribute option allows you to select the attribute whose values are displayed within corresponding map shapes.

				Wash. Mo	ont.	N.D.	Minn.	1
				re. Idaho		S.D.	Wie	
Title attibute:	ABBREV	× 2			Wyo.	Nebr.	Iowa	Pa
	-			Nev. Utał	Colo.	Kans.	Mo.	Ку. та.
	OK	Cancel		Ariz	N.M.	Okla	Ark.	
			4			т	La.	Ga.

#### **Tooltips**

Geo Point maps also allow you to add supplementary content to the callout/bubble/pie tooltips using the TooltipData Items area. To learn more, see the Tooltip Data Items paragraph in the Providing Data topic.

# **Map Navigation**

Geo Point maps allow you to perform navigation actions such as zooming and scrolling.

The Dashboard Designer allows you to specify the initial zooming/scrolling state for the Geo Point map using the mouse. You can disable the capability to scroll/zoom the map using the Lock Navigation button in the Design ribbon tab.

Use the Full Extent button to display the entire map within the dashboard item.

# **Range Filter**

The Range Filter dashboard item allows you to apply filtering to other dashboard items. This item displays a chart with selection thumbs that allow you to filter out values displayed along the argument axis.

#### **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner.

The only difference is in the data sections that the required dashboard item has. This topic describes how to bind a Range Filter dashboard item to data in the Designer.

The image below shows a sample Range Filter dashboard item that is bound to data.

To bind the Range Filter dashboard item to data, drag and drop a data source field to a placeholder contained in one of the available data sections. A table below lists and describes Range Filter data sections.

Section	Description
Values	Contains Data Items against which the Y-coordinates of data points are calculated.
Argument	Contains a data item that provides values displayed along the horizontal axis of the Range Filter. Filtering is performed based on these values. Note that the Option s button (the icon) allows you to create predefined ran ges used to select the required date- time interval.
Series	Contains Data Items whose values are used to create chart series.

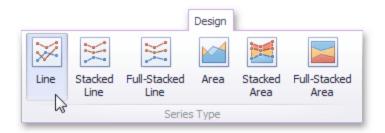

#### Series

The Range Filter dashboard item supports various Line and Area series types.

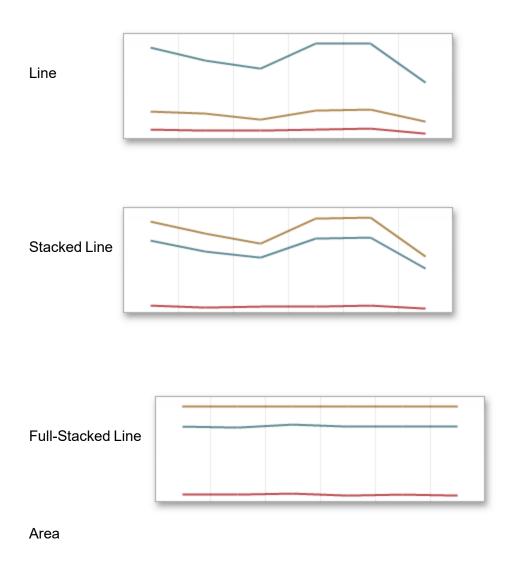

To switch between series types in the Designer, click the options button next to the required data item in the Values section. In the invoked Series Type dialog, select the required series type and click **OK**.

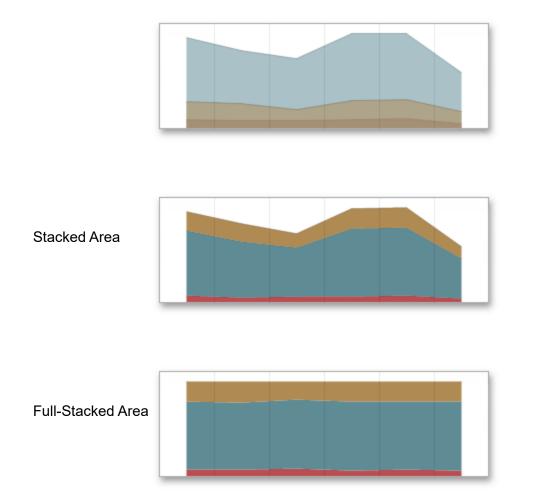

Value
Series Type
Range Filter
OK Cancel

You can also do this using the buttons in the Series Type group of the Design Ribbon tab.

The Range Filter supports the following series types:

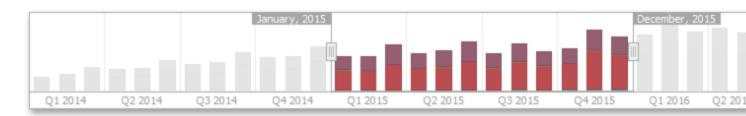

#### Interactivity

This document describes the features that enable interaction between the Range Filter and other dashboard items. These features include Master Filtering.

#### **Master Filtering**

The Dashboard allows you to use any data-aware dashboard item as a filter for other dashboard items (Master Filter).

Master filtering is always enabled for the Range Filter dashboard item. This Range Filter displays a chart with selection thumbs that allow you to filter out values displayed along the argument axis.

To enable filtering across data sources for the Range Filter, use the Cross-Data-Source Filtering button in the Data Ribbon tab.

You can enable/disable ignoring of other master filter items using the Ignore Master Filters button in the Data Ribbon tab.

#### **Predefined Ranges**

The Range Filter dashboard item allows you to add a number of predefined date-time periods that can be used to perform a selection (for instance, year-to-date or quarter-to-date).

To add a period, click the Options button (the **\*** icon) next to the Argument placeholder or use the **Edit Periods** button in the ribbon's Design tab. This invokes the Edit Periods dialog.

Last Year Last 2 Years Last 3 Years Last 3 Years Last 5 Years This Year Next Year Last Quarter This Quarter Next Quarter Next Quarter Last 3 Months Last 3 Months Last 3 Months Last 12 Months Last 12 Months This Month Next Month Next Month	Filter by All	-	Edit	Delete	1	$\downarrow$	Add Custo	m Period
	Last 2 Years Last 3 Years Last 5 Years This Year Next Year Last Quarter Next Quarter Last Quarter Last Month Last 3 Months Last 6 Months Last 12 Months This Month	•				Period		Default

To add the selected period, use the  $\rightarrow$  button or double-click this period.

ilter by All	-	Edit	Delete	<b>↑</b>	$\mathbf{+}$	Add Custom Period
Last Year Last 2 Years		Caption			Period	Defaul
Last 3 Years Last 5 Years This Year		This Year			2016	C
Next Year Last Quarter						
This Quarter						

This period will be added to the right pane of the Edit Periods dialog. The following settings are available for the added period:

- Caption: Specifies the caption corresponding to the period.
- **Period**: Displays the date-time interval corresponding to the period.
- **Default**: Allows you to use the selected period as the default selection in the Range Filter dashboard item.

If necessary, you can customize the selected period by clicking the **Edit** button in the Edit Periods dialog. This invokes the Period dialog.

Period	×
Year	O Previous Year
◯ Quarter	This Year
○ Month	🔘 Next Year
◯ Day	O Last 1 🚔 years
◯ Custom	Next 1 vears
	◯ Year-to-date
	Include current
	2016
	OK Cancel

Note that the Edit dialog above contains the displayed periods (Year, Quarter, Month, Day) if the group interval of the Range Filter argument is set to Day-Month-Year.

This dialog allows you to add the following periods:

- Year: A period duration is measured in years.
  - Previous Year: Identifies the entire previous year.
  - This Year: Identifies the entire current year.
  - **Next Year**: Identifies the entire next year.
  - **Last Years**: Identifies a specific number of previous years. Use the Include current option to specify whether or not the period is ended with the current year.
  - **Next Years**: Identifies a specific number of next years. Use the Include current option to specify whether or not the period is started from the current year.
  - **Year-to-date**: A period from the beginning of the current year and up to the current day.
- Quarter: Period duration is measured in quarters.
  - **Previous Quarter**: Identifies the entire previous quarter.
  - This Quarter: Identifies the entire current quarter.
  - Next Quarter: Identifies the entire next quarter.
  - **Last Quarters**: Identifies a specific number of previous quarters. Use the Include current option to specify whether or not the period ends with the current quarter.
  - **Next Quarters**: Identifies a specific number of following quarters. Use the Include current option to specify whether or not the period starts from the current quarter.
  - **Quarter-to-date**: A period from the beginning of the current quarter and up to the current day.
- Month: Period duration is measured in months.
  - **Previous Month**: Identifies the entire previous month.
  - This Month: Identifies the entire current month.
  - Next Month: Identifies the entire next month.

- **Last Months**: Identifies a specific number of previous months. Use the Include current option to specify whether or not the period ends with the current month.
- **Next Months**: Identifies a specific number of the following months. Use the Include current option to specify whether or not the period starts with the current month.
- **Month-to-date**: A period from the beginning of the current month and up to the current day.
- **Day**: Period duration is measured in days.
  - **Previous Day**: Identifies the entire previous day.
  - This Day: Identifies the entire current day.
  - **Next Day**: Identifies the entire next day.
  - **Last Day**: Identifies a specific number of previous days. Use the Include current option to specify whether or not the period ends with the current day.
  - **Next Days**: Identifies a specific number of the following days. Use the Include current option to specify whether or not the period starts with the current day.
- Custom: A custom period. Allows you to specify a period with the custom boundaries

Period		×
Quarter	Start point	<ul> <li>○ None ● Fixed ○ Flow</li> <li>1/1/2015 ▼</li> </ul>
O Month	End point	○ None ○ Fixed ● Flow
Custom		Interval: Year 💌 Offset: 1 🛓
		1/1/2015 - 12/31/2016
		OK Cancel

You can specify the following settings for the start/end boundaries:

- **None**: The selection will begin from the start/end of the visible range.
- **Fixed**: Allows you to select a specific date value using the calendar.
- **Flow**: Allows you to select a relative date value. The Interval option specifies the interval between the current date and the required date. The Offset option allows you to set the number of such intervals.

Note that the Offset option can accept negative and positive values. Negative values correspond to dates before the current date, while positive values correspond to future dates.

## Coloring

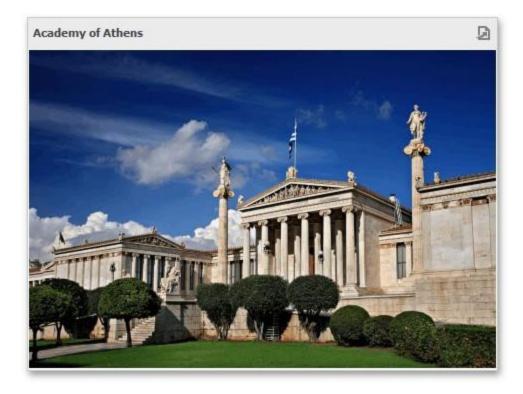

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

By default, the Range Filter dashboard item colors different measures and series dimensions by hue. The image below illustrates the Range Filter dashboard item whose series points corresponding to different categories are colored in different colors.

#### Images

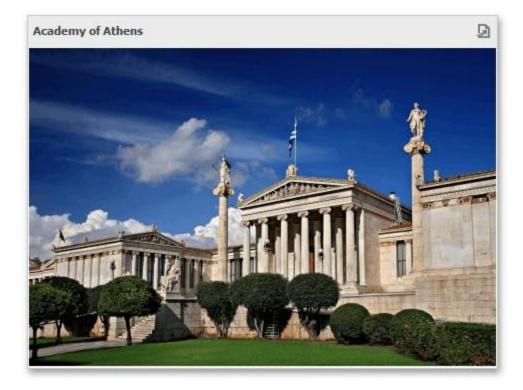

The Dashboard Designer allows you to add images to a dashboard.

You can either add a static image or you can use the Bound Image as a detail item along with the Master Filtering feature.

#### Image Types Overview

The Dashboard Designer allows you to create two types of an Image dashboard item. The Image dashboard item allows you to add static images to a dashboard.

The **Bound Image** dashboard item can be bound to a set of images (for instance, stored in the database). You can use the Bound Image as a detail item along with the Master Filtering feature.

Category	Picture
Beverages	
Condiments	
Confections	
Dairy Products	
Grains/Cereals	
Meat/Poultry	
Produce Seafood	

To create the required Image dashboard item, use the **Images** button in the Home ribbon tab.

Imag T	es		
	Ima	age	
	Во	und Image	13

#### **Providing Images**

#### **Static Images**

To load an image to a dashboard item, use the Load Image and Import Image buttons in the Ribbon, or commands in the context menu (Load Image and Import Image respectively).

These commands invoke the Open dialog, which allows you to locate the desired image.

The Load Image command saves the path to the image in the dashboard definition, while the Import Image command saves the image itself.

#### Binding the Bound Image to Data

The Bound Image dashboard item provides the Attribute data section containing the corresponding placeholder.

Specify the binding mode for the Bound Image by clicking the Options button (the icon) next to the Attribute placeholder. This invokes the following dialog

Image Binding Option	IS	x
<ul> <li>Binary Array</li> <li>URI</li> </ul>		
URI Pattern:		
	Insert Placeholder	
	OK Cancel App	ly

This dialog provides two options:

- **Binary Array**: Use this mode if images are stored in the data source as byte arrays.
- **URI**: Use this mode to locate images accessible by a predefined URI. In this case, the data source field should return strings that are parts of URIs to these images.

For instance, the URI pattern in the form below specifies the path to the folder containing the required images.

Image Binding Option	ns	×
<ul> <li>Binary Array</li> <li>URI</li> </ul>		
URI Pattern:	os 17.1\Components\Data\ProductDetailsImages\{0}.jpg Insert Placeholder	
	OK Cancel App	ly

Data source field values will be inserted to the position of the {0} placeholder. Thus, the Bound Image maps the current dimension value with the image placed at the specified URI.

Note that the Bound Image can display only a single image simultaneously. If Master Filtering is not applied to the Bound Image, it selects the displayed image in the following ways:

- In the Binary Array mode, the displayed image cannot be predicted precisely as a result of sorting limitations for the image/binary data types. Use the Master Filtering feature to display the specified image.
- In the URI mode, the Bound Image displays an image corresponding a first attribute value taking into account the attribute's sort order.

#### Interactivity

This document describes the features that enable interaction between the Bound Image and other dashboard items. These features include Master Filtering.

#### **Master Filtering**

The Dashboard allows you to use most of the data-aware dashboard items as a filter for other dashboard items (Master Filter).

Data displayed in the Bound Image dashboard item can be filtered by other master filter items. For instance, the Bound Image below shows an image corresponding to a category selected in the Grid dashboard item.

You can prevent the Bound Image from being affected by other master filter items using the Ignore Master Filters button on the Data ribbon tab.

## **Image Settings**

You can customize the representation of Image and Bound Image dashboard items in different ways.

#### Image Aligntment

To specify how the image is aligned within the dashboard item, use the Alignment group in the Design ribbon tab.

•						
Alignment						

#### Image Size Mode

You can specify the image size mode that defines how the image fits within the dashboard item. To do this, use the Size Mode group in the Ribbon's Design tab.

The following table illustrates each size mode in two cases: when the image is smaller than the dashboard item, and vice versa.

Size Mode	Image Smaller than Dashboard Item	Image Larger than Dashboard Item	Descripti on
			The image is
<u></u>			clipped if
Clippe d			it is larger than the
u			Image
			dashboar
			d item.

image is stretched or shrunk to fit the size of the dashboar

If the dimensio

Stretch

ns of the Image dashboar d item exceed those of the image it contains, the image is shown in fullsize. Other wise, the image is resized to fit the dimensio

Zoom

ns of the Image dashboar d item.

The image is sized proportionally (without clipping), so that it best fits the Image dashboard item. If the aspect ratio of the Image dashboard item is the same as the aspect ratio of the image, it will be resized to fit into the Image dashboard item while maintaining its aspect ratio. Otherwise, the image will be resized in the closest fitting dimension (either the height or the width), and the remaining dimension will be resized while maintaining the image's aspect ratio.

#### **Text Box**

Use the Text Box dashboard item to display rich text within a dashboard.

Product	Product Description		G
DesktopLCD 21 DesktopLED 21	DesktopLCD 21		i

It's amazing build quality and high precision the best possible computer picture for the best ers crystal-clear images with mind-blowing video. ple, this Monitor offers Full HD resolution with	

You can either add a static text or you can use the Text Box as a detail item along with the Master Filtering or Filtering features.

#### **Editing Text**

To edit the text within the Text Box, click the Edit button in the ribbon's Design tab or use the corresponding item in the context menu.

This adds the Text Box Editor context category to the Dashboard Designer's ribbon and allows you to modify the content within the Text Box.

					Ute	1940	ere.	de						19	#10	र इसा	81						
					Da	ta	Desi	ign	FB	e	Home	In	sert	Pag	e Lay	tuo	Des	gn	Layou	t Format

	Clipboard						Font								Pa	ragrag	ah.			St	vles		Editin

To learn how to edit the content within the Text Box, see Rich Text Editor. After you change the document, click **Edit** again to finish editing.

Note that the Text Box can be bound to data. To learn how to do this, see Providing Data.

#### **Providing Data**

The Text Box dashboard item can be bound to data as other data-aware dashboard items. To do this, perform the following steps:

1. Drop the Name, RetailPrice and Description data source fields from the Products table to the Values section of the Text Box.

DATA ITEMS	Text Box 1	B
Values		
Name (Min)		
RetailPrice (Sum)		
Description (Min)		
Value		

Note that summary types of the created measures are Min, Sum and Min, respectively.

2. Click the Edit button in the Design ribbon tab and add the Name, Retail Price and Description strings to the document.

DATA ITEMS	Text Box 1	ß
Values	Name:	
Name (Min)	Retail Price: Description:	
RetailPrice (Sum)	Description	
Description (Min)		
Value		

3. Place the pointer next to Name, right-click the document and select Insert Field (or use the Insert Field button in the ribbon). Then, click the Select value placeholder and select the Name (Min) measure.

Name: Select val	ue
Retail Price:	Name (Min)
Description:	RetailPrice (Sum)
	Description (Min)

4. Perform the third step for Retail Price and Description.

Name: Name (Min) Retail Price: RetailPrice (Sum) Description: Description (Min)

5. Click the Edit button again to leave the editing mode. The Text Box will show data in the following way:

# Text Box 1 Image: DesktopLCD 21 Retail Price: \$170 Description: The 21" Brilliance LCD Computer Monitor is changing the way people display computer signals. It's amazing build quality and high precision design means you get the best possible computer picture for the best possible price. It delivers crystal-clear images with mind-blowing video. The bottom-line is simple, this Monitor offers Full HD resolution with 240Hz refresh rate.

You can use this Text Box as a detail item along with the Master Filtering feature to filter data according to the selected product.

## Interactivity

This document describes the features that enable interaction between the Text Box and other dashboard items. These features include Master Filtering.

#### **Master Filtering**

The Dashboard allows you to use most of the data-aware dashboard items as a filter for other dashboard items (Master Filter).

Data displayed in the Text Box dashboard item can be filtered by other master filter items. For instance, the Text Box below shows data corresponding to a product selected in the List Box dashboard item.

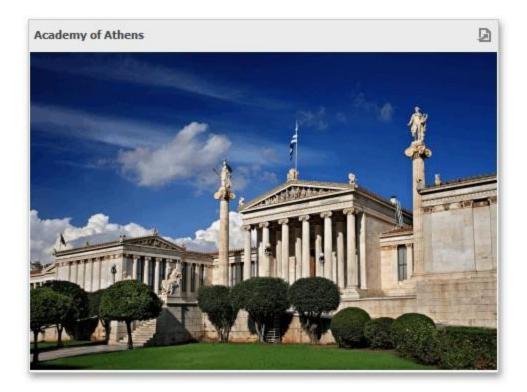

Product	Product Description		G
DesktopLCD 21 DesktopLED 21	DesktopLCD 21		i
HD Video Player Projector Plus	Production Start:	31-Mar-10	
Projector PlusHD SuperLCD 42	Consumer Rating:	3 of 5

# Treemap

Use the Treemap dashboard item to visualize data in nested rectangles that are called tiles.

Furniture					
Chairs & Chairmats	Tables		Bookcases		
			Office Furnishing	js	
Office Sup	nlies				
Office Sup Binders and Binder	plies Storage & Organiza	Appli	Paper		
	Chairs &	Chairs & Tables	Chairs & Tables	Chairs & Tables Bookcases Chairmats	

The Treemap displays labels that contain descriptions for tiles and groups, and provide tooltips with additional information.

				Group labels
	Techr	iology	Fur	niture
Tile labels	Office	Machines	Cha	irs & Chairmats
Tile tooltip	Off	ice Machines: 1.22M		

#### **Providing Data**

The Dashboard Designer allows you to bind various dashboard items to data in a virtually uniform manner. The only difference is in the data sections that the required dashboard item has.

The Treemap dashboard item has the Values and Arguments data sections that provide numeric and discrete categorical data, respectively. The steps below provide the most common scenarios of binding a Treemap to data.

1. Drop the Sales and Profit fields to the Values section. The Treemap will draw two tiles whose sizes correspond to the Sales and Profit summary values.

ATA ITEMS	Treemap 1	Į.
alues	Sales (Sum)	Profit (Sum)
Sales (Sum)		(Sull)
Profit (Sum)		
Value		
rguments		
Argument		
IDDEN DATA ITEMS		
Vimensions		

2. Drop the Product Category field to Arguments. The Treemap will create individual tiles for

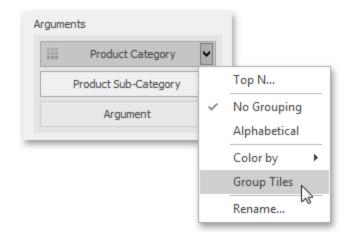

all categories. You can switch between Sales and Profit values by clicking the icon 🗲 in the item's caption or you can use its context menu.

DATA ITEMS	Treemap 1 - Sales (	(Sum)	D 🜮	
Values	Technology	Furniture	Office Supplies	/ Sales (
Sales (Sum)				Profit
Profit (Sum)				
Value				
Arguments				
III Product Category				
Argument				

3. Drop the child Product Sub-Category field into Arguments. The Treemap will visualize all combinations of categories and corresponding sub-categories using individual tiles.

DATA ITEMS	Treemap 1 - Sales (Sum)				D 5		
Values Sales (Sum) Profit (Sum)	Technology - Office Machines	Technology - Telephones and Communication	Technology – Copiers and Fax		Office Supplies - Binders and Binder Accessories		
Value			Office Supplies - Storage & Organizat	Technol - Comput Periphe	Supplies - Applian		
Arguments	Furniture - Chairs & Chairmats	Furniture - Tables					
Product Category			Furniture - Bookcases	Furnit - Office Furnis	Supplies -		
Product Sub-Category Argument				rurnis	Of Office Su		

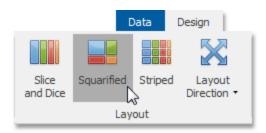

4. If the Arguments section contains several dimensions, you can group child tiles by values of the parent dimension. To group sub-categories inside corresponding categories, click the **Category Name** menu button and select **Group Tiles**. Sub-category tiles will be grouped into category groups.

DATA ITEMS	Treemap 1 -	Treemap 1 - Sales (Sum)				
Values	Technolog	у	Furniture	e	Office Supp	
Sales (Sum)	Office	Telephones	Chairs & Chairmats		Binders and Binder Accessories	
Profit (Sum)	Machines	and Communic				
Value					Storage &	
Arguments			Tables	Bookcases	Organizati	on
Product Category					Applian	En
Product Sub-Category	Copiers and Fax	Computer Peripher		Office Furnishi		Pe
Argument					Paper	

#### Layout

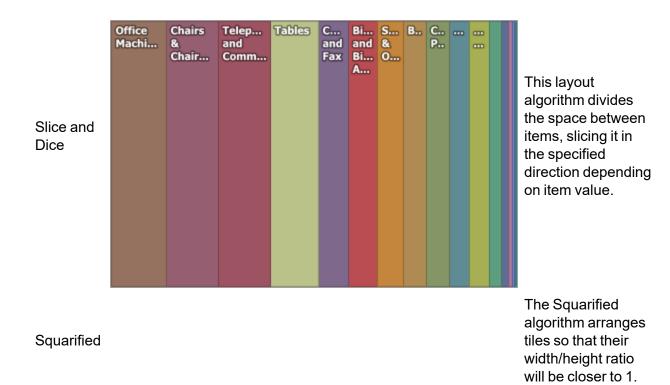

This topic describes how to change a layout algorithm used to arrange Treemap tiles. To do this in the Designer, use buttons from the Layout group placed in the Design ribbon tab.

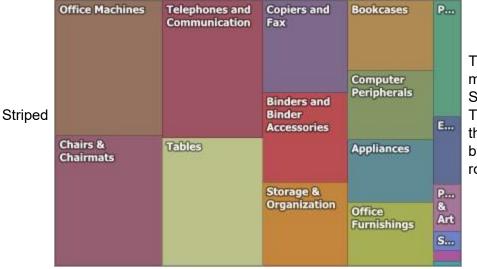

The following algorithms are available:

#### Algorithm Example

#### Description

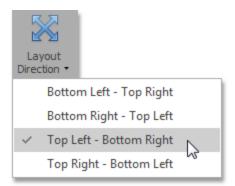

Office Machines	Telephones and Communication	Copiers and Fax		Binders and Binder Accessories		
Chairs &	Tables	Storage & Organizat		puter pher	Applia	
Chairmats		Bookcases	Offic Furn	fis	Paper En Pens & Art 	

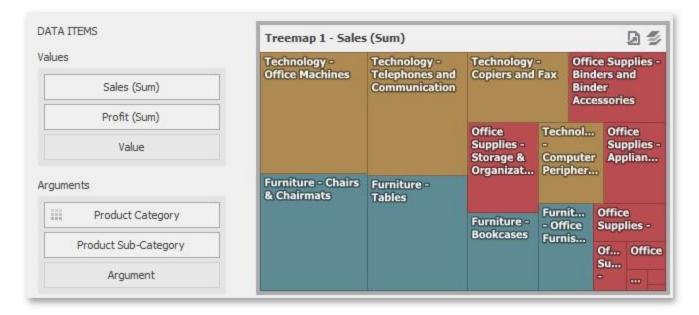

This algorithm is a modified version of the Squarified algorithm. The difference here is that tiles are drawn side by side as columns or rows.

You can also set a layout direction to specify an arrangement of tiles depending on their sizes. To do this, click the **Layout Direction** button and select the required direction.

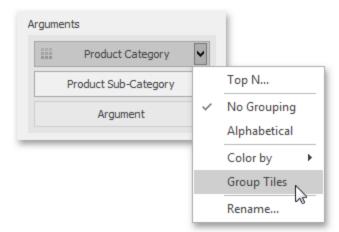

## Grouping

If you use several arguments in the Treemap, you can group tiles corresponding to child values by parent values. For instance, the following Treemap dashboard item displays combinations of categories and sub-categories.

To group sub-categories inside corresponding categories, click the Product Category menu button and select **Group Tiles**.

Product tiles will be grouped into category groups.

DATA ITEMS	Treemap 1 -	D 5				
Values	Technology		Furniture		Office Supp	
Sales (Sum)	Office	Telephones	Chairs & Chairmats		Binders and Binder Accessories	
Profit (Sum)	Machines	and Communic				
Value					Storage &	
Arguments			Tables	Bookcases	Organizati	on
Product Category					Applian	En
Product Sub-Category	Copiers and Fax	Computer Peripher		Office Furnishi		Pem
Argument					Paper	&

Note that the 🖃 icon will be displayed within the Product Category dimension.

## Coloring

Certain dashboard items provide the capability to color dashboard item elements by associating dimension values/ measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

By default, the Treemap dashboard item colors its tiles in the following way:

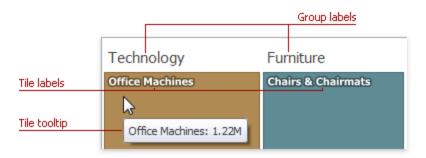

- If the Treemap dashboard item contains only measures (the **Values** section), values corresponding to different measures are colored by hue.
- If the Treemap dashboard item contains arguments (the **Arguments** section), values corresponding to the first argument are colored by hue.

If necessary, you can change the default behavior. For instance, the image below shows the Treemap dashboard item whose measures and argument values are painted with the same color.

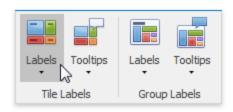

ATA ITEMS	Treemap 1 -	Sales (Sum)			01
alues	Technolog	y	Furniture	Office S	upp
Sales (Sum)	Office	Telephones	Chairs & Chairmats	Binders a	nd
Profit (Sum)	Machines	and Communic		Binder Accessori	es
Value				Storage &	1
rauments			Tables	Organizat	
Product Category				Applia	Pa
Product Sub-Category	Copiers and Fax	Computer Peripher	Bookcases Office Furnishi		
Argument				Enve P	<b>e</b>

## Labels

The Treemap displays labels that contain descriptions for tiles and groups, and provide tooltips with additional information.

You can specify which information should be displayed within tile and group labels separately. To do this, use the **Labels** and **Tooltips** buttons in the Design Ribbon tab.

Use buttons within the Tile Labels/Group Labels ribbon groups to manage tile and group labels, respectively. These buttons invoke the drop-down menu, which is similar for all buttons.

	None
~	Argument
	Value
	Argument and Value

# **Filter Elements**

Filter elements represent a special type of dashboard item that allows you to apply filtering to other dashboard items.

## **Filter Elements Overview**

The Dashboard Designer allows you to create three types of filter elements that provide the capability to filter other dashboard items.

To add the required filter element to the dashboard, use the **Filter Elements** button in the Home ribbon tab.

## **Combo Box**

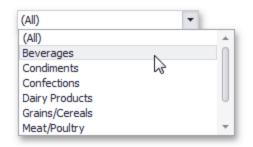

The Combo Box dashboard item allows you to select a value(s) from the drop-down list. You can switch the combo box type in the ribbon Design tab.

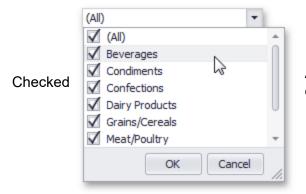

Combo Box Example Type Standard

Description

Allows you to select only a single value.

Allows you to select multiple values in the invoked drop-down list.

## **List Box**

The List Box dashboard item allows you to select a value(s) from the list. You can switch the list box type in the ribbon Design tab.

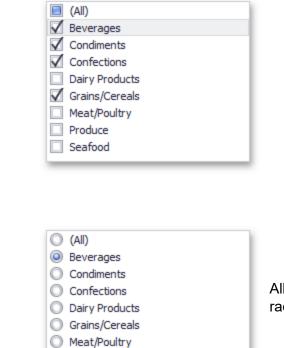

List Box Type Example

Checked

Description

Allows you to select multiple values in the list box.

Produce

Seafood

Allows you to select only a single value in the radio group.

### **Tree View**

Radio

The Tree View dashboard item displays values in a hierarchical way and allows you to expand/collapse nodes.

(All)
÷ 📃 1994
August
🗹 September
October
November
December
1995
1996

You can manage the initial expanded state of filter values using the Auto Expand button in the Design ribbon tab.

## **Providing Data**

This topic describes how to bind filter elements to data using the Dashboard Designer.

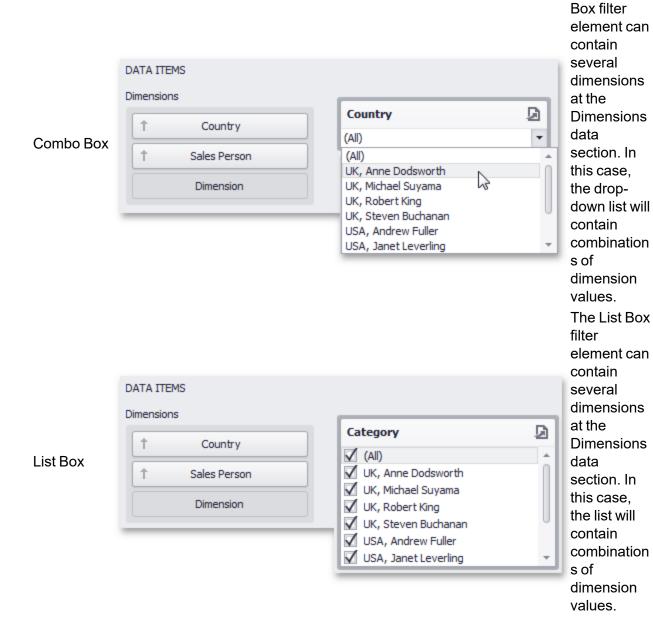

The Dashboard Designer allows you to bind various dashboard items to data in a consistent manner, the only difference being the data sections that these dashboard items comprise.

## **Binding Overview**

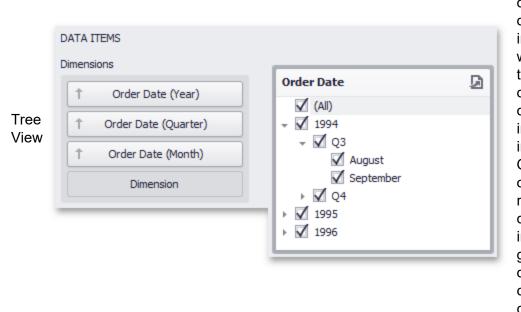

All filter elements provide the Dimensions data section, which accepts dimensions used to provide filter values. To learn about the specifics of binding various filter elements to data, see the table below.

Dashboard Item

Description

The Combo

The Tree View filter element allows you to display dimension values in a hierarchical way. This can be the set of dimensions with different group intervals (for instance, Year/ Quarter/Month) or the set of related dimensions (for instance, geographic al data such as continents/ countries/ cities).

## Interactivity

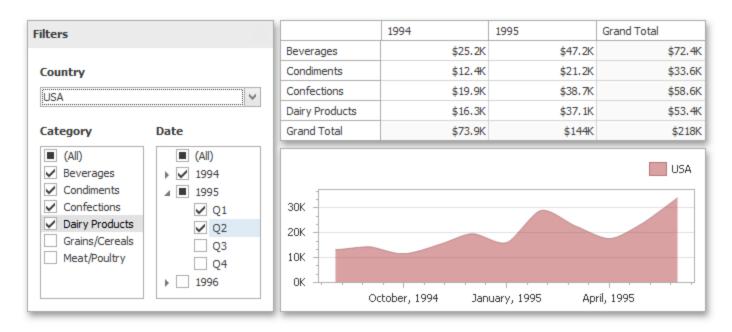

This document describes the filtering capabilities supported by filter elements. You can use filter elements to apply master filtering to other dashboard items or introduce hierarchical filtering by adding several connected filters.

### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter).

Note that filter elements do not support Master Filter selection modes. You can switch the selection mode by changing the type of the required filter element.

Depending on the filter element type, you can select a value(s) to make other dashboard items display only data related to the selected value(s).

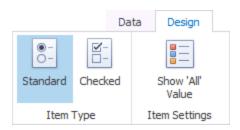

You can also create a set of related filter elements containing relevant filter values. For instance, in the image below, the State/Province filter element contains states related to the 'United States' value, while the City filter element contains cities related to the 'New York' value.

Country	State/Province		City
<ul> <li>(All)</li> <li>Australia</li> <li>Canada</li> <li>France</li> <li>Germany</li> <li>United Kingdom</li> <li>✓ United States</li> </ul>	<ul> <li>Nevada</li> <li>New Hampshire</li> <li>New Mexico</li> <li>New York</li> <li>North Carolina</li> <li>Ohio</li> <li>Oregon</li> <li>Rhode Island</li> </ul>	<	<ul> <li>(All)</li> <li>Cheektowaga</li> <li>Endicott</li> <li>Lake George</li> <li>Melville</li> <li>New Hartford</li> <li>New York</li> <li>Valley Stream</li> </ul>

Disable the Ignore Master Filters option for the required filter element to allow applying filtering to this element.

### **Filter Element Options**

Filter elements provide the capability to specify whether to enable the (All) option that allows you to apply filtering by all values. To do this, use the **Show 'All' Value** button in the Design ribbon tab.

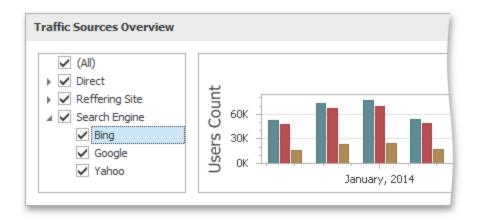

Note that this capability is supported by the 'Standard' Combo Box and 'Radio' List Box filter elements.

# **Dashboard Item Group**

The BI Dashboard provides the capability to combine dashboard items into a group. The dashboard item group serves two main purposes:

- Combine dashboard items within the dashboard into a separate layout group.
- Manage interaction between dashboard items within and outside the group.

For instance, you can combine related filter elements and data visualization dashboard items into a group.

## **Create a Group**

To create a new group, use the **Group** button in the Home ribbon tab.

You can add dashboard items to a group and manage item layout using drag-and-drop.

Note that a dashboard item group cannot be added to another group.

## Interactivity

The dashboard item group provides the capability to manage interactions between dashboard items within and outside the group.

The **Master Filter** button allows you to specify whether the current group allows you to filter external dashboard items using master filter items contained within the group. If this option is disabled, master filter items contained within the group can filter only dashboard items from this group.

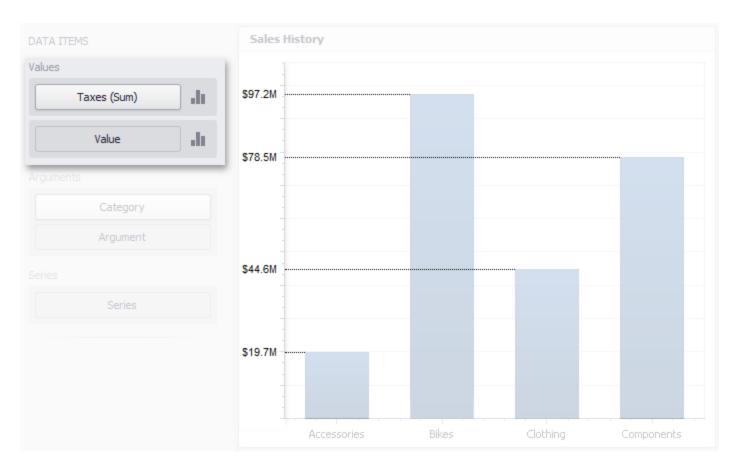

The **Ignore Master Filters** button allows you to isolate dashboard items contained within the group from being filtered using external master filter items.

## **Data Shaping**

This section describes how to perform various data shaping operations (such as grouping, sorting and filtering) in the Dashboard Designer.

### Summarization

To obtain numeric values that should be displayed within a dashboard item, Dashboard calculates a summary function against the specified measure.

This topic describes how to specify which summary function should be calculated against a particular measure.

#### **Summary Function Types**

The following summary functions are available:

**Count**: The number of values (excluding Null and DBNull values). This is the only summary type that can be calculated against non-numeric data.

Count Distinct: The number of distinct values.

**Sum**: The sum of the values.

$$Sum = \sum_{i} v_i$$

Min: The smallest value.

Max: The largest value.

Average: The average of the values.

$$\bar{v} = \frac{1}{n} \cdot \sum_{i} v_i \bar{v} = \frac{1}{n} \cdot \sum_{i} v_i$$

**StdDev**: An estimate of the standard deviation of a population, where the sample is a subset of the entire population.

$$\bar{v} = \frac{1}{n} \cdot \sum_{i} v_{i}$$

$$StdDev = \sqrt{\frac{1}{n-1} \cdot \sum_{i} (v_{i} - \bar{v})^{2}}$$

**StdDevP**: The standard deviation of a population, where the population is the entire data to be summarized.

$$StdDevp = \sqrt{\frac{1}{n} \cdot \sum_{i} (v_i - \bar{v})^2}$$

**Var**: An estimate of the variance of a population, where the sample is a subset of the entire population.

$$Var = \frac{1}{n-1} \cdot \sum_{i} (v_i - \bar{v})^2$$

VarP: The variance of a population, where the population is the entire data to be summarized.

$$Varp = \frac{1}{n} \cdot \sum_{i} (v_i - \bar{v})^2$$

**Median**: The m edian of the values (excluding Null and DBNull values). A m edian is the number separating the higher half of a value range from the lower half.

#### **Changing Summary Type**

By default, Dashboard calculates Sum for numeric measures and Count for measures that contain another type of data.

You can change the summary function type for numeric measures. To do this in the Designer, invoke the data item menu and select the desired summary type. Less common summary types are organized in the More sub-menu.

DATA ITEMS		1	
Values			
Amount (Sum)	-		
Value		Count	
		Count Distinct	
	<ul> <li>✓</li> </ul>	Sum	
		Min	
		Max	
		Average	StdDev
		More 🔸	StdDevP
		Format	Var
		Color by	VarP
		Rename	Median

### Grouping

The Dashboard Designer allows you to group dimension values and display summaries for entire groups rather than individual values.

You can arrange dimension values in groups of different sizes by specifying the appropriate group interval. For instance, date-time values can be grouped by years, months, quarters, etc.

This topic lists the supported text and date-time group intervals, and describes how to change the group interval.

#### **Text Group Intervals**

String values support the following grouping intervals.

**No Grouping** Each value is displayed "as is". **Alphabetical** Values are grouped alphabetically (e.g., A, B, C, ... Z).

#### **Date-Time Group Intervals**

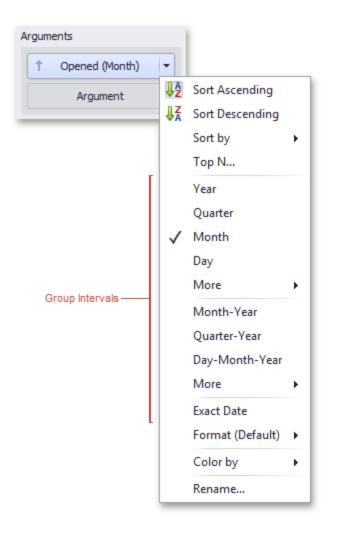

Date-time values support the following group intervals.

Examples in the table below are formatted using the default settings.

Group Interval	Description	Examples
Year	Valuesare groupedbytheyear.	2010,2011,2012
Quarter	Valuesare groupedbythequarter.	Q1,Q2,Q3,Q4
Month	Valuesare groupedbythemonth.	January,February,March, December
Day	Valuesaregroupedbythedayof the month.	1,2,3,31
Hour	Valuesare groupedbythehour.	0,1,2,23
Minute	Valuesare groupedbytheminute.	0,1,2,59
Second	Valuesare groupedbythesecond.	0,1,2,59
Day of the Year	Valuesaregroupedbythedayof the year.	1,2,3,365
Day of the Week	Valuesaregroupedbythedayof the week.	Sunday,Monday,Tuesday, Saturday
Week of the Yea	Valuesaregroupedbytheweekof the r year.	1,2,3,52
Week of the Month	Valuesaregroupedbytheweekof the month.	1,2,3,4,5
Month-Year	Valuesaregroupedbytheyear and month.	January2012,February2012,
		December2012,January2013,
Quarter-Year	Valuesaregroupedbytheyear and quarter.	Q32012,Q42012,Q12013,Q2
Quarter-real	valuesalegioupeubytileyear and quarter.	2013,
Day-Month-Year	· Valuesaregroupedby date.	3/4/2012,3/5/2012,3/6/2012,
Date-Hour	Valuesaregroupedbydatewith the hour value.	3/4/20120:00AM,3/4/20121:00 AM, 3/4/2012 2:00 AM,
Date-Hour- Minute	Valuesaregroupedbydatewith the hour and minute values.	3/4/20120:00AM,3/4/20120:01 AM, 3/4/2012 0:02 AM,

#### **Changing Group Interval**

To specify the group interval in the Designer, invoke the data item menu and select the desired group interval. Less common group intervals are organized in the More submenus.

## Sorting

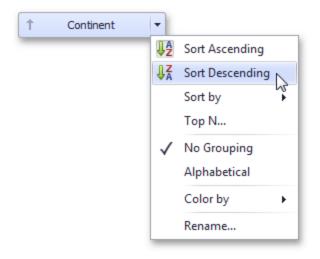

The Dashboard Designer allows you to easily change the sort order of values within a dashboard item. You can also enable sorting by parameter values.

#### **Changing Sort Order**

The sort order of dimension values is indicated with an arrow.

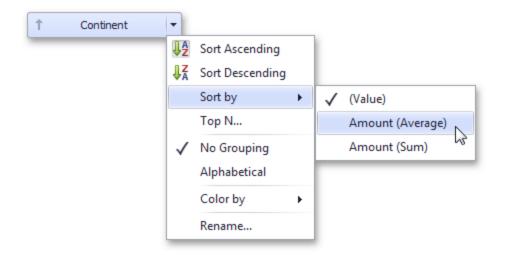

д	Sorting Indicator
Ť	Continent

To change the sort order in the Designer, click the data item. You can also toggle sorting from the data item menu.

#### Sorting by Measure Values

Dashboard allows you to sort dimension values by summary values calculated for a specific measure. To enable sorting by measure in the Designer, use the Sort by submenu in the dimension's menu.

You can also sort dimension values by the values of hidden measures.

### Filtering

The Dashboard allows you to filter a query of the SQL Data Source or apply filtering to a specific data-aware dashboard item.

This topic describes how to enable and reset filtering.

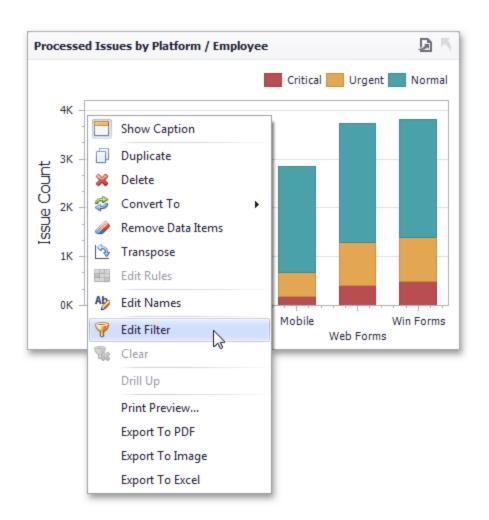

#### **Apply Filtering**

To configure filtering, select the target dashboard item and do one of the following:

• If you are using a Ribbon menu, click the Edit Filter button in the Data tab.

• Right-click a dashboard item and select Edit Filter from its context menu.

This will invoke the **Filter Editor** dialog. Use this dialog to build filter criteria with a convenient tree-like interface.

Filter Editor	x
And C [IssueType] Equals Critical ProductName] Equals Silverlight Windows 8 Wpf Mobile Web Forms Win Forms Win Forms	
OK Cancel Apply	

You can use hidden dimensions within the Filter Editor dialog, allowing you to filter data based on their values.

#### **Clear Filtering**

To clear filtering in the Designer, select the target dashboard item and do one of the following:

• If you are using a Ribbon menu, click the **Clear** button in the Data tab.

• Right-click a dashboard item and select Clear from its context menu.

For hierarchies, a tree is displayed instead, allowing you to filter individual values at any hierarchy level.

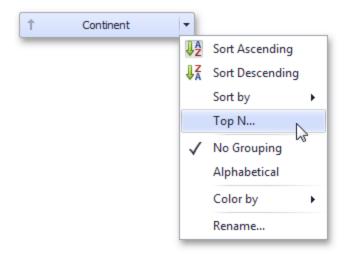

Filter Editor	x

## Top N

The Top N feature allows you to display only a limited number of values that correspond to the highest or lowest values of a particular measure.

To display the top values in a dimension, select **Top N** from the data item menu.

This invokes the Top N Values dialog.

Top N Values		x
Enabled		
Mode:	Тор	•
Count:	5	÷ ‡
Measure:	Amount (Sum)	•
Show "Others" value:		
ОК	Cancel	Apply

In this dialog, check the **Enabled** check box and specify the following settings.

ModeSpecifies whether top or bottom values should be displayed.CountThe number of values to be displayed.

MeasureThe parameter that will determine the top or bottom value.ShowIf enabled, all values that are not the top/bottom values are consolidated in the"Others" Value"Others" value.

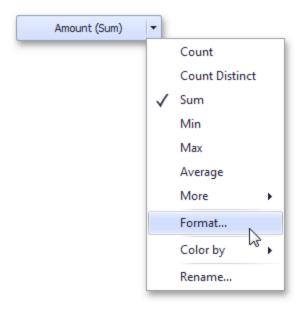

You can use the hidden measure as a parameter that will determine the top or bottom value.

### **Formatting Data**

Dashboard allows you to customize various data format settings for numeric and date-time values.

#### **Formatting Numeric Values**

To specify a format for numeric values, select Format from the data item menu.

This invokes the Numeric Format window.

Numeric Format		x
Format type:	Auto	•
Unit:	Auto	·
Precision:		2 🖕
Currency:	Use dashboard settings	~
Currency culture:	Use dashboard settings	~
🗌 Indude group se	parator	
	\$1.23B (\$1.23B)	
	OK	Cancel

In the Format type field, select the required format type.

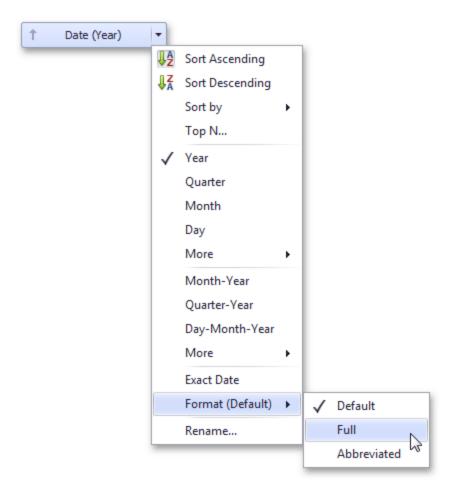

Auto	Format settings are automatically determined based on the data type.
General	Converts a number to the most compact of either fixed-point or scientific notation, depending on the type of the number.
Number	Converts a number to a string of the "-d,ddd,ddd. ddd" form where "-" indicates a negative number symbol (if required), "d" indicates a digit (0-9), "," indicates a group separator, and "." indicates a decimal point symbol.
Currency	Converts a number to a string that represents a currency amount. To learn about currency formatting specifics, see the Currency Formatting Specifics section of this document.
Scientific	Converts a number to a string of the "-d.dddE+ddd" or "-d.ddde+ddd" form where each "d" indicates a digit (0-9).
Percent	Multiplies a number by 100 and converts it to a percentage string.
Other forma	at settings are in effect for only specific format types.
C a tt i va av	Preservicient

Setting	Description	Format Types
Unit	The unit to which values should be converted.	Number, Currency

Precision The number of fractional digits that should be displayed.	Scientific, Percent

Include group separator groups.	etween digit Number, Currency, Percent

#### Formatting Date-Time Values

To specify a format for date-time values, use the Format submenu in the data item menu.

This submenu lists the available format types that depend on the selected group interval.

Specific group intervals do not have format options. This means that corresponding values can only be presented in a single manner. The Format submenu is not displayed for such group intervals.

The following list shows format types by group interval:

- Year
  - Full: The full year pattern (Example 6/15/2017 1:45:30 PM -> 2017 (en-US)).

**Abbreviated**: The year from 00 to 99 (Example - 6/15/2017 1:45:30 PM -> 17 (en-US)).

- Quarter
  - Full: The full quarter pattern (Example: 6/15/2017 1:45:30 PM -> Q2 (en-US)).
  - Numeric: The quarter from 1 through 4 (Example: 6/15/2017 1:45:30 PM -> 2 (en-US)).
- Month
  - Full: The full name of the month (Example: 6/15/2017 1:45:30 PM -> June (en-US)).
  - Abbreviated: The abbreviated name of the month (Example: 6/15/2017 1:45:30 PM Jun (en-US)). N u m eric The month from 1 through 12 (Example: 6/15/2017 1:45:30 PM -> 6 (en-US)).
- Hour
  - Long: Long hour pattern, 12-hour format (Example: 6/15/2017 1:45:30 PM -> 1:00 PM).
    - Short: Short hour pattern, 24-hour format (Example: 6/15/2017 1:45:30 PM -> 13).
- Day of Week
  - Full: The full name of the day of the week (Example: 6/15/2017 1:45:30 PM -> Monday (en-US)).
  - **Abbreviated**: The abbreviated name of the day of the week (Example: 6/15/2017 1:45:30 PM -> Mon (en-US)).

- Numeric: The day of the week from 1 through 7 (Example: 6/15/2017 1:45:30 PM -> 2 (en-US)).
- Day-Month-Year
  - Long: Long date pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 (en-US)).

Short: Short date pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 (en-US)).

- Date-Hour
  - Long: Long date pattern, long hour pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:00 PM (en-US)).
  - Short: Short date pattern, long hour pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:00 PM (en-US)).
  - Time only: Long hour pattern (Example: 6/15/2017 1:45:30 PM -> 1:00 PM (en-US)).
- Date-Hour-Minute
  - Long: Long date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:45 PM (en-US)).
  - Short: Short date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:45 PM (en-US)).
  - Tim e only: Long time pattern (Example: 6/15/2017 1:45:30 PM -> 1:45 PM (en-US)).
- Date-Hour-Minute-Second
  - Long: Long date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:45:30 PM (en-US)).
  - Short: Short date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:45:30 PM (en-US)).
  - Tim e only: Long time pattern (Example: 6/15/2017 1:45:30 PM -> 1:45:30 PM (en-US)).

The list below illustrates format types related to the Exact Date group interval:

• Year

- Full: The full year pattern (Example: 6/15/2017 1:45:30 PM -> 2017 (en-US)).
- Abbreviated: The year from 00 to 99 (Example: 6/15/2017 1:45:30 PM -> 17 (en-US)).
- Quarter
  - n /a The default year and full quarter pattern (Example: 6/15/2017 1:45:30 PM -> Q2 2017 (en-US)).

• Month

 n /a - The default year pattern and the full name of the month (Example: 6/15/2017 1:45:30 PM -> June, 2017 (en-US)).

• Day

- Long: Long date pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 (en-US)).
- Short: Short date pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 (en-US)).

• Hour

- Long: Long date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:00 PM (en-US)).
- Short: Short date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:00 PM (en-US)).
- Time only: Long time pattern (Example: 6/15/2017 1:45:30 PM -> 1:00 PM (en-US)).
- Minute
  - Long: Long date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:45 PM (en-US)).
  - Short: Short date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:45 PM (en-US)).
  - Tim e only: Long time pattern (Example: 6/15/2017 1:45:30 PM -> 1:45 PM (en-US)).

- Second
  - Long: Long date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> Monday, June 15, 2017 1:45:30 PM (en-US)).
  - Short: Short date pattern, long time pattern (Example: 6/15/2017 1:45:30 PM -> 6/15/2017 1:45:30 PM (en-US)).

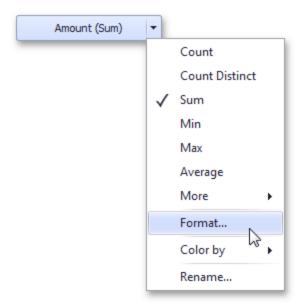

**Time only**: Long time pattern (Example: 6/15/2017 1:45:30 PM -> 1:45:30 PM (en-US)).

### **Currency Formatting Specifics**

The Dashboard allows you to specify a currency format at two levels: for the entire dashboard and for individual Data Items.

#### **Data Item Currency**

To specify which currency to use for a particular data item, select Format from the data item menu.

In the Numeric Format dialog, select **Currency** in the Format type field and use the Currency combo box to select the required currency.

Numeric Format		X
Format type:	Currency -	
Unit:	Auto 👻	
Precision:	2 🚖	
Currency:	Use dashboard settings 🔹	
Currency culture:	EEK (Estonian Kroon) EGP (Egyptian Pound) ETB (Ethiopian Birr)	
Indude group sep		
	GTQ (Guatemalan Quetzal) * (\$1.23B)	
	OK Cance	ł

This option only affects the way values are displayed. The Dashboard does not convert monetary amounts from one currency to another.

For regions with several cultures, you can also select the culture that will be used to format currency values.

Currency:	EUR (Euro)	•
Currency culture:	Alsatian (France)	•
	German (Austria)	*
	German (Germany)	
	German (Luxembourg)	
	Greek (Greece)	0
	Irish (Ireland)	
	Italian (Italy)	
	Lower Sorbian (Germany)	-

You can also apply the default dashboard currency by selecting **Use dashboard settings** in the Currency field.

#### **Dashboard Currency**

You can also specify the default currency for the dashboard. This setting will be applied to dashboard items that have no currency defined.

To set the dashboard currency, click the **Currency** button in the Ribbon.

This invokes the Dashboard Currency window. In this window, select the required currency using the Currency combo box.

Dashboard Currency			x
Currency:	Use client system settings		•
Currency culture:	EEK (Estonian Kroon)		<b>A</b>
currency current	EGP (Egyptian Pound)		
	ETB (Ethiopian Birr)		0
	EUR (Euro)		
	GBP (UK Pound Sterling) GEL (Lari)	~	
	GTQ (Guatemalan Quetzal)		-
		ок	Cancel
			Cancel

This option only affects the way values are displayed. The Dashboard does not convert monetary amounts from one currency to another.

For regions with several cultures, you can also select the culture that will be used to format currency values.

Currency:	EUR (Euro)	•
Currency culture:	Alsatian (France)	•
	German (Austria)	
	German (Germany)	
	German (Luxembourg)	
	Greek (Greece)	0
	Irish (Ireland)	
	Italian (Italy)	
	Lower Sorbian (Germany)	Ŧ

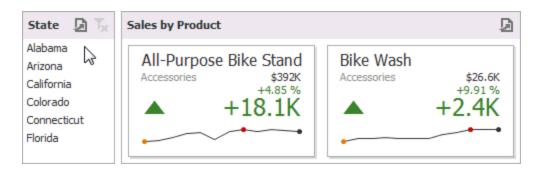

Additionally, you can specify the client culture that should be used for the dashboard by selecting the **Use client system** settings item. In this instance, the current system culture will be used in WinForms applications, and the client culture will be used in Web applications.

## Interactivity

This section describes features that enable interaction between various dashboard items. These features include Master Filtering and Drill-Down.

### **Master Filtering**

The Dashboard allows you to use any data aware dashboard item as a filter for other dashboard items (Master Filter). You can select elements in a Master Filter item (grid records, chart bars, pie segments, etc.) to filter data in other dashboard items by the selected values.

#### **Master Filtering Overview**

Dashboard items can be divided into four groups by their master filtering capabilities.

Data visualization dashboard items allow you to enable master filtering by specifying the selection mode.

• Filter elements represent a special type of dashboard item whose main purpose is to apply filtering to other dashboard items. This capability is always enabled for these dashboard items.

The following filter elements are available:

- Combo Box
- List Box

• Tree View

Instead of switching between standard master filtering modes, some filter elements allow you to switch their type. This allows you to select a single value or multiple values.

- Range Filter is a special type of dashboard item that displays a chart with selection thumbs and allows you to filter out values displayed along the argument axis.
- Dashboard item group allows you to manage interaction between dashboard items in and out of the group.

The Master Filter item supports two selection modes:

- Multiple: Allows you to select multiple elements in the Master Filter item.
- **Single**: Allows you to select only one element in the Master Filter item. When this mode is enabled, the default selection will be set to a Master Filter element. You can change this selection, but cannot clear it.

To enable/disable master filtering, use the **Multiple Master Filter** or **Single Master Filter** buttons in the Data Ribbon tab.

If the selected dashboard item contains several types of elements that can be used for filtering, the Ribbon or Toolbar will provide the appropriate buttons to switch between these types (e.g., the Arguments and Series buttons in the Chart).

#### **Filtering Across Data Sources**

When different items in a dashboard are bound to different data sources, you can specify that a particular Master Filter should be applied across data sources. This means that it will apply filtering to fields with matching names in all data sources.

Fields are matched by their full names. For fields in other data sources to be affected by Master Filtering, their names must match the name of the field in the current data source, and they must belong to the same hierarchy level so that their full names also match. For instance, Cu stom er.City and Cu stom er.Addres s.City will not be treated as matching fields.

To enable filtering across data sources, use the Cross-Data-Source Filtering button in the Data Ribbon tab.

#### **Preventing Items from Being Filtered**

You can prevent specific dashboard items from being affected by Master Filters. To do this, use the Ignore Master Filters button in the Data Ribbon tab.

#### **Apply Filtering**

To learn how to apply filtering in a specific dashboard item, refer to the **Master Filtering** topic in the Interactivity section for this item.

#### **Drill-Down**

Dashboard provides the Drill-Down feature, which allows you to change the detail level of data displayed in a dashboard item. The Drill-Down feature enables users to drill down to display detail data, or drill up to view more general information.

#### EnableDrill-Down

Drill-down requires that the data section contains several dimensions or a hierarchy data item.

12,
ť2,
ť2,
A
12,
Category Subcategory Product

To enable drill-down, click the Drill-Down button in the Data Ribbon tab (or the button if you are using the toolbar menu).

If the selected dashboard item contains several types of elements that can be used for drill-down, the Ribbon or Toolbar will provide the appropriate buttons to switch between these types (e.g., Arguments and Series buttons in a Chart). For details, refer to the documentation for the individual dashboard items in the Designing Dashboard Items topic.

The following dashboard items support the Drill-Down feature:

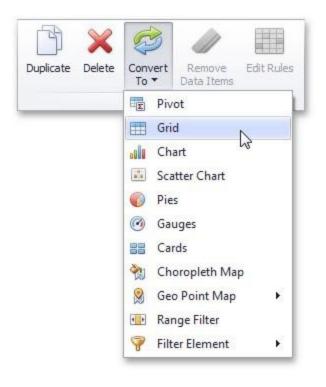

- Chart
- Scatter Chart
- Grid
- Pies
- Cards
- Gauges
- Treemap

### **Perform Drill-Down**

To learn how you can drill down using a particular dashboard item, refer to the **Drill-Down** topic in the Interactivity section for this item.

# **Converting Dashboard Items**

The BI Dashboard Designer provides the capability to convert data-bound dashboard items to another type. To convert the selected dashboard item to another type, use the Convert button in the ribbon's Home tab or the corresponding command in the item's context menu.

The BI Dashboard Designer always preserves the following settings for data-bound dashboard items:

- The set of Data Items used to bind the dashboard item to data.
- Data shaping settings of Data Items and their names.
- A custom name displayed within the dashboard item caption.

The following settings are kept if the dashboard item is being converted to an item that also supports this feature:

- Master Filtering settings (e.g., the specified master filter mode) and Drill-Down settings (e.g., the target dimension).
- Conditional Formatting settings.
- Coloring settings.
- Calculation settings.

For different types of dashboard items, some specific settings can be preserved. For example, the following settings are preserved:

- Legend settings for the Chart/Scatter Chart dashboard items.
- Series types for the Chart/Range Filter dashboard items.
- Element arrangement settings for the Pie/Card/Gauge dashboard items.
- Caption settings for the Pie/Gauge dashboard items.
- Navigation settings for Choropleth Map/Geo Point Maps.
- The attribute whose values are displayed within shape titles for Choropleth Map/Geo Point Maps.
- Legend settings for the Choropleth Map/Geo Point Maps.
- Clustering settings for Geo Point Maps.

The topics in this section describe how to customize the appearance of a dashboard or any of its elements using conditional formatting and coloring.

# **Conditional Formatting**

The Dashboard Designer provides the capability to apply formatting to dashboard item elements whose values meet the specified condition. This feature allows you to highlight specific elements using a predefined set of rules.

Product Sale	s YTD					
Category	Product		Revenue YTD

# **Conditional Formatting Overview**

Comparison rules used in conditional formatting can be divided into the following groups.

- **Value** :Allows you to compare static values (such as Greater Than, Less Than, Between, etc.).
- **Top-Bottom**: Highlights a specific number of topmost/bottommost values.
- Average: Highlights values above the average value or below the average value.
- A Date Occurring: Allows you to highlight date-time values that fall into a specified interval.
- **Expression**: Allows you to use complex conditions to apply formatting. You can also pass dashboard parameters to expressions.
- **Icon Ranges**: Allows you to apply formatting by displaying specific icons for different ranges of values. You can select a predefined set of icons or use a specific icon for each range.
- **Color Ranges**: Allows you to apply formatting using specific colors for different ranges of values. You can select a predefined set of colors or use custom appearance settings to highlight values within specified ranges.
- Gradient Ranges: Allows you to apply formatting using gradient color scales.
- **Bar**: Allows you to visualize numeric values using bars. You can also color bars corresponding to positive and negative values using different colors.
- **Bar Color Ranges**: Allows you to visualize numeric values using bars whose colors are contained in the specified color set.
- Bar Gradient Ranges: Allows you to visualize numeric values using bars whose colors are contained in the specified color gradient.

You can create comparison rules for measures or dimensions. The list below shows format conditions that can be applied to different types of Data Items.

- Measure/numeric
- Dimension Value
- Top-Bottom Average
- Expression
- Icon Ranges

- Color Ranges
- Gradient Ranges
- Bar
- Bar Color Ranges
- Bar Gradient Ranges
- String Dimension
- Value with the condition type set to Equal To, Not Equal To or Text that Contains Expression
- Date-Time
- Dimension Value
- A Date Occuring for dimensions with the continuous date-time group interval Expression
- Icon Ranges
- Color Ranges
- Gradient Ranges Bar
- Bar Color Ranges
- Bar Gradient Ranges

# **Create a Format Rule**

To create a new rule used to apply formatting according to the required condition, do the following

1. Choose a measure/dimension by whose values a format condition will be calculated. Click the measure/ dimension menu button, select Add Format Rule and choose the condition

New Column	Count Count Distinct ✓ Sum	
	Min Max Average More Format	Image: Second secon
	Add Format Rule       Image: Boot State       Image:	Color Ranges

2. This invokes the dialog that depends on the selected format condition and the type of dashboard item. For instance, the image below displays the Greater Than dialog corresponding to the Value format condition for the Grid dashboard item.

Greater Than ×
Format Extended Price values that are greater than
<enter a="" value=""></enter>
Appearance Icons
B I U Gr R Y G B
Custom Appearance
Apply to
Extended Price 🔻
Apply to row
OK Cancel Apply

In this dialog, specify settings specific for the selected condition (for instance, specify a value to compare with dimension/measure values). To learn more, see the documentation for the required condition.

3. Specify appearance settings applied to elements whose values meet the specified condition.

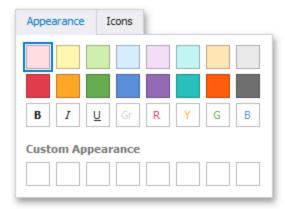

4. Specify the data item to whose values conditional formatting is applied using the **Apply to** combo box.

Thus, you can create a format rule for one data item and apply new appearance settings to the other data item. You can also create format rules for hidden measures and apply formatting to values of visible Data Items. Different dashboard items can provide additional capabilities for creating a new format rule. To learn more, refer to documentation for the required dashboard item.

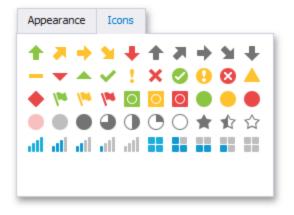

### **Specify Appearance Settings**

When creating a new format rule, you can select the required appearance settings applied according to the current format condition. All format conditions allow you to customize appearance settings in a similar manner. For instance, the Value format condition allows you to specify appearance settings in the following way:

The Appearance tab allows you to choose the predefined background color/font.

The Icons tab allows you to add the predefined icon.

Use the Custom Appearance area in the Appearance tab to add presets containing custom appearance settings. To add a new preset, click an empty square. This invokes the Custom Style Settings dialog, allowing you to specify the required appearance settings.

Custom Style Settings	×
Background color Text color	▼ B I <u>U</u>
(Automatic) Andalus Angsana New AngsanaUPC Aparajita Arabic Typesetting Arial Arial Black Arial Narrow Arial Unicode MS Batang Batang BatangChe Book Antiqua	
Previev	w
	Create Cancel

In this dialog, you can specify the backgoround/foreground colors and font settings. Click Create to add a preset. The created preset will be displayed in the Custom Appearance area.

# Edit a Format Rule

To edit format rules for the selected dashboard item, click the **Edit Rules** button in the Home ribbon tab.

As an alternative, use the Edit Rules data item's menu item or the corresponding item in the dashboard item's context menu.

This invokes the Edit Rules dialog containing existing format rules for this dashboard item.

Ed		Filter by: [All]	
	Caption	Calculated By	Applies To
$\checkmark$	Top N (N= 3)	Extended Price	Sales Person
$\checkmark$	Set of [4] ranges	Extended Price	Extended Price
$\checkmark$	Below Average	Extended Price	Sales Person
Add	ala data di u Calas Bassas		
Add	<ul> <li>calculated by Sales Person</li> </ul>	1	

This dialog allows you to perform the following actions:

- To edit the selected rule, use the Edit button or double-click the required rule.
- To delete the selected rule, use the **Delete** button.
- To reorder format rules, use the **Up** and **Down** buttons (the and icon, respectively). Reordering of rules allows you to specify the priority of rules from higher (a bottommost rule) to lower (a topmost rule).
- To enable/disable the required rule, use the corresponding check box on the left column.

- To create a new rule, click the **Add** button and select the required format condition. The **Calculated By** combo box allows you to select the measure/dimension by whose values a format rule is applied.
- To filter format rules by the specified data item, use the Filter by combo box.

To clear all rules for the specified data item, use the **Clear Rules** button in the data item's context menu.

# Value

The Value format condition allows you to compare static values (such as Greater Than, Less Than, Between, etc.). The following condition types are supported for measures or date-time dimensions:

### **Greater Than/Greater Than or Equal To**

The "Greater Than"/"Greater Than or Equal To" format conditions allow you to apply formatting to elements whose values are greater than/greater than or equal to the specified value. For instance, the following image displays a Grid dashboard item whose Exten ded Price cells are filled in green if their values are Greater Than 150 000.

Greater Than	x Sales Perso	son Extended Price
	Margaret Pe	Peacock \$233K
	Janet Lever	erling \$203K
Format Extended Price values that are greater than	Nancy Dave	volio \$192K
150000	Andrew Ful	uller \$167K
	Laura Calla	ahan \$127K
Appearance Icons	Robert King	ng \$125K
	Anne Dodsv	sworth \$77.3K
	Michael Suy	uyama \$73.9K
	Steven Bud	uchanan \$68.8K

This format condition can be applied to measures or date-time dimensions.

### Less Than/Less Than or Equal To

The "Less Than"/"Less Than or Equal To" format conditions allow you to apply formatting to elements whose values are less than/less than or equal to the specified value. For instance, the following image displays a Grid dashboard item whose E xten ded Price cells are filled in red if their values are Less Than 150 000.

Less Than	x	Sales Person	Extended Price
Less findin	^	Margaret Peacock	\$233K
		Janet Leverling	\$203K
Format Extended Price values that are less than		Nancy Davolio	\$192K
150000		Andrew Fuller	\$167K
		Laura Callahan	\$127K
Appearance Icons		Robert King	\$125K
	- 1	Anne Dodsworth	\$77.3K
		Michael Suyama	\$73.9K
		Steven Buchanan	\$68.8K

This format condition can be applied to measures or date-time dimensions.

### **Equal To/Not Equal To**

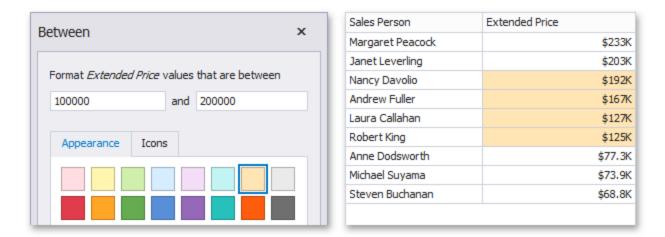

The "Equal To"/"Not Equal To" format conditions allow you to apply formatting to elements whose values are equal to/not equal to the specified value. For instance, the following image displays a Grid dashboard item whose Sales Pers on cells are filled in blue if their values are equal to 'Robert King'.

aual To	× Sales Pe	rson	Extended Price
Equal To		t Peacock	\$233K
	Janet Le	verling	\$203K
Format Sales Person values that are equal to	Nancy D	avolio	\$192K
Robert King	Andrew	Fuller	\$167K
	Laura Ca	llahan	\$127
Appearance Icons	Robert K	ing	\$125K
	Anne Do	dsworth	\$77.3K
	Michael S	Suyama	\$73.9K
	Steven E	Buchanan	\$68.8K

This format condition can be applied to measures, string or date-time dimensions.

### **Between/Not Between**

The "Between"/"Not Between" format conditions allow you to apply formatting to elements whose values are between/not between the specified values. For instance, the following image displays a Grid dashboard item whose E xten ded Price cells are filled in orange if their values are Between 100 000 and 200 000.

This format condition can be applied to measures or date-time dimensions

The "Text That Contains" format condition allows you to apply formatting to elements whose values contain the specified text. For instance, the following image displays a Grid dashboard item whose Sales Pers on cells are in cyan if their values contain the 'An' text.

Margaret Peacock Janet Leverling	\$233K \$203K
	\$203K
Nancy Davolio	\$192K
Andrew Fuller	\$167K
Laura Callahan	\$127K
Robert King	\$125K
Anne Dodsworth	\$77.3K
Michael Suyama	\$73.9K
Steven Buchanan	\$68.8K
	Andrew Fuller Laura Callahan Robert King Anne Dodsworth Michael Suyama

This format condition can be applied to measures, string or date-time dimensions.

# **Top-Bottom**

The Top-Bottom format conditions allow you to highlight a specific number of topmost/bottommost values. You can specify this number as an absolute or percent value.

The following condition types are supported for measures:

### Top N

The "Top N" format condition allows you to apply formatting to elements whose values are ranked at the top. For instance, the following image displays a Grid dashboard item whose top 3 E xten ded Price values filled in green.

	Extended Price
Margaret Peacock	\$233K
Janet Leverling	\$203K
Nancy Davolio	\$192K
Andrew Fuller	\$167K
Laura Callahan	\$127K
Robert King	\$125K
Anne Dodsworth	\$77.3K
Michael Suyama	\$73.9K
Steven Buchanan	\$68.8K
	Janet Leverling Nancy Davolio Andrew Fuller Laura Callahan Robert King Anne Dodsworth Michael Suyama

### **Bottom N**

The "Bottom N" format condition allows you to apply formatting to elements whose values are ranked at the bottom. For instance, the following image displays a Grid dashboard item whose bottom 40 percent Exten ded Price values are filled in red.

Bottom N ×	Sales Person	Extended Price
	Margaret Peacock	\$233K
	Janet Leverling	\$203K
Format <i>Extended Price</i> values that rank in the bottom	Nancy Davolio	\$192K
N = 40.00 % 💂 🗸 % of all values	Andrew Fuller	\$167K
	Laura Callahan	\$127K
Appearance Icons	Robert King	\$125K
	Anne Dodsworth	\$77.3K
	Michael Suyama	\$73.9K
	Steven Buchanan	\$68.8K

# Average

The Average format conditions allow you to highlight values above or below an average value. The following condition types are supported for measures:

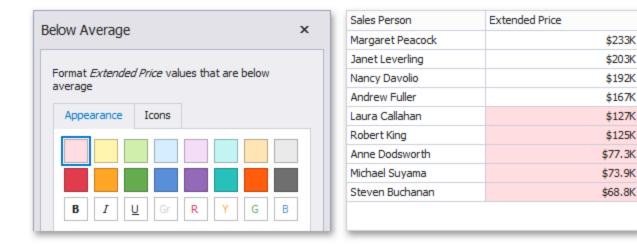

## Above Average/Above of Equal Average

The "Above Average"/"Above or Equal Average" format conditions allow you to apply formatting to elements whose values are above/above or equal to the average. For instance, the following image displays a Grid dashboard item whose E xten ded Price values that are above average (~ 141 000) filled in green.

Margaret Peacock Janet Leverling Nancy Davolio Andrew Fuller Laura Callahan	\$233K \$203K \$192K \$167K \$127K
Nancy Davolio Andrew Fuller	\$192K \$167K
Andrew Fuller	\$167K
aura Callahan	¢1274
	\$12/K
Robert King	\$125K
Anne Dodsworth	\$77.3K
Michael Suyama	\$73.9K
Steven Buchanan	\$68.8K
M	Inne Dodsworth Iichael Suyama

### **Below Average/Below or Equal Average**

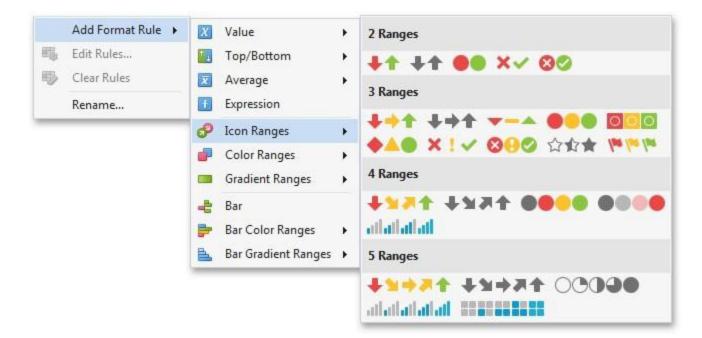

The "Below Average"/"Below or Equal Average" format conditions allow you to apply formatting to elements whose values are below/below or equal to the average. For instance, the following image displays a Grid dashboard item whose E xten ded Price values that are below average (~ 141 000) filled in red.

# **Icon Ranges**

Icon Ranges allow you to use predefined or custom sets of icons to apply conditional formatting to different ranges of values.

To format values according the required condition, click the data item menu button, select **Add Format Rule | Icon Ranges** and choose the required icon set.

This invokes the Range Set dialog containing the set of value ranges and corresponding icons. The Grid dashboard item on the right displays the default formatting applied using the predefined set of 3 icons.

lange Set			x
Format Ext conditions	<i>ended Price</i> valu	es using ra	inge
Format styl	e		
<b>—</b>			-
✓ Use %ı

-	33.00 %	>=	0.00 %
Add	Delete		Reverse
Apply to			
Extended I	Price		-
Apply to	row		
	ОК	Cancel	Apply

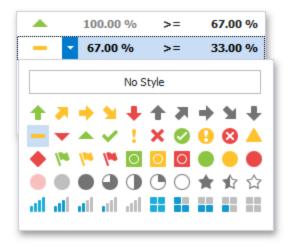

Sales Person	Extended Pri	ce
Margaret Peacock	<b></b>	\$233K
Janet Leverling	<b></b>	\$203K
Nancy Davolio	<b></b>	\$192K
Andrew Fuller	-	\$167K
Laura Callahan	-	\$127K
Robert King	-	\$125K
Anne Dodsworth	-	\$77.3K
Michael Suyama	-	\$73.9K
Steven Buchanan	-	\$68.8K

This dialog allows you to change the following options specific to Icon Ranges.

- The Format Style combo box allows you to change the icon set used to apply formatting.
- The Use % ranges check box specifies whether the percent or absolute scale is used to generate ranges.

Note that this option is not available for date-time dimensions.

To change the icon displayed for values corresponding to the specified range, click the button next to the required icon and select a new icon.

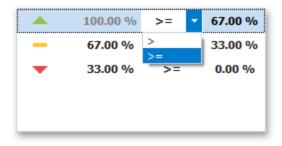

Select No Style to disable the indication for the required range.

You can change range boundaries by specifying the required values.

	<b>100.00</b> %	>=	<b>67.00</b> %
_	80.00%	>=	33.00 %
-	33.00 %	>=	0.00 %

Note that a new value should fall into a range between corresponding values of the previous and next range.

To change the comparison logic for the required range, click the comparison sign and select the required option.

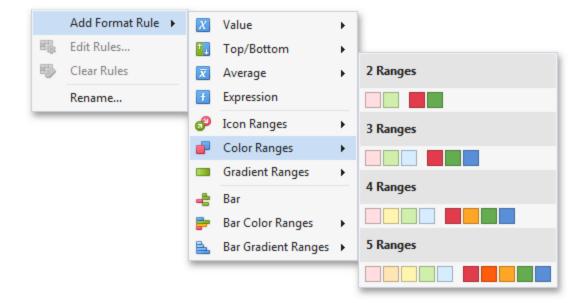

The greater or equal sign includes the smallest value of the current interval while the greater sigh excludes the smallest value from the current interval and includes it in the next interval.

Use the **Add** and **Delete** buttons to add new ranges or delete the selected range respectively. Note that new range is added below the selected range.

# **Color Ranges**

Color Ranges allow you to use predefined sets of colors to apply conditional formatting to different ranges of values. You can also use custom appearance settings for specific ranges.

To format values according the required condition, click the data item menu button, select Add Format Rule | Color Ranges and choose the required icon set.

This invokes the Range Set dialog containing the set of value ranges and corresponding appearance settings. The Grid dashboard item on the right displays the default formatting applied using the predefined set of 3 colors.

Select **No Style** to disable the indication for the required range.

You can change range boundaries by specifying the required values.

100.00 %	>=	67.00 %
80.00%	>=	33.00 %
33.00 %	>=	0.00 %

Note that a new value should fall into a range between corresponding values of the previous and next range.

To change the comparison logic for the required range, click the comparison sign and select the required option.

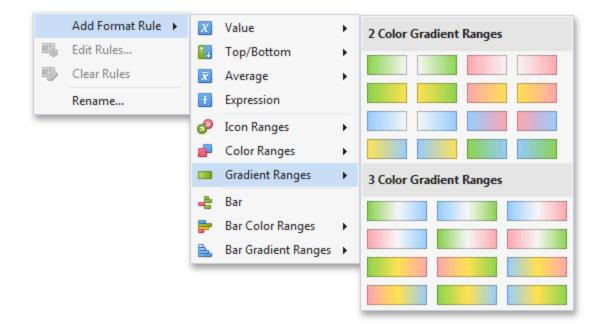

The greater or equal sign includes the smallest value for the current interval while the greater sigh excludes the smallest value from the current interval and includes it in the next interval.

Use the Add and Delete buttons to add new ranges or delete the selected range respectively.

# **Gradient Ranges**

Gradient Ranges allow you to use predefined color gradients to apply conditional formatting to different ranges of values. You can also use specific colors to generate custom gradients.

To format values according the required condition, click the measure menu button, select Add Format Rule | Color Ranges and choose the required color gradient.

This invokes the Gradient Ranges dialog containing the set of value ranges and corresponding appearance settings. The Grid dashboard item on the right displays the default formatting applied using the predefined Red- Blue gradient.

Andrew Fuller	\$167K
Laura Callahan	\$127K
Robert King	\$125K
Anne Dodsworth	\$77.3K
Michael Suyama	\$73.9K
Steven Buchanan	\$68.8K

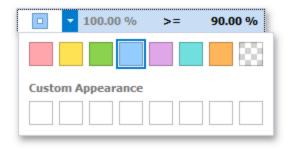

This dialog allows you to change the following options specific to Gradient Ranges.

Number of ranges allows you to specify the number of ranges used to classify values. Click the

 Generate Ranges button to generate a new gradient scale according to the specified number of ranges. The Use % ranges check box specifies whether the percent or absolute scale is used to generate ranges.

Note that this option is not available for date-time dimensions.

To change the specific color in the gradient, click the button next to the required color and select a new color or specify a custom background color. This allows you to create a color gradient based on more than two colors. In this case, the specified colors are marked with an empty square.

You can change range boundaries by specifying the required values.

100.00 %	>=	85.00 %
<b>85.00</b> %	>=	80.00 %
80.00 %	>=	70.00 %

Note that a new value should fall into a range between corresponding values of the previous and next range.

To change the comparison logic for the required range, click the comparison sign and select the required option.

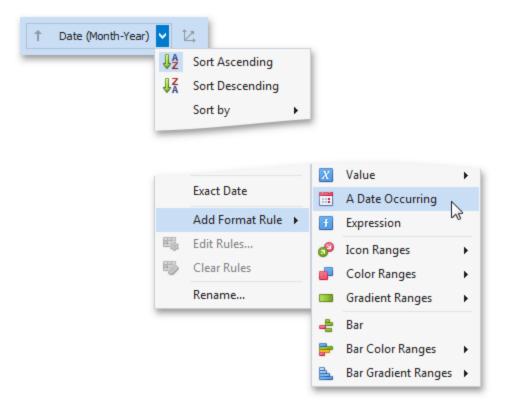

100.00 %	>=	-	90.00 %
90.00 %	>		80.00 %
80.00 %	>=		70.00 %

The greater or equal sign includes the smallest value in the current interval while the greater sigh excludes the smallest value from the current interval and includes it in the next interval.

# A Date Occurring

A Date Occurring format condition allows you to highlight date-time values that fall into a specified interval. Note that this format condition can be applied to dimensions with the continuous date-time group interval.

To format values according the Date Occurring condition, click the menu button of the required dimension and select **Add Format Rule | A Date Occurring**.

This invokes the A Date Occurring dialog that allows you to select a date-time interval(s) whose value should be formatted.

A Date Occurring ×	
Format OrderDate values that contain a date matching these conditions	
Is yesterday

OK Cancel Apply	

The following intervals are supported:

- Is beyond this year Dates that follow the current year.
- Is later this year Dates of the current year starting from the following month.
- Is later this month Dates of the current month that follow the next week.
- Is later this week Dates of the current week starting from the day after tomorrow.
- Is next week Dates that belong to the following week.
- Is tomorrow Tomorrow.

- Is today Today.
- Is yesterday Yesterday.
- Is earlier this week Dates of the current week that are prior to yesterday.
- Is last week Dates of the previous week.
- Is earlier this month Dates of the current month that are prior to the previous week.
- Is earlier this year Dates of the current year that are prior to the current month.
- Is prior to this year Dates that are prior to the current year.
- Empty Does not specify any condition.
- Beyond Dates that belong to the month in three-months time and beyond.
- ThisWeek Dates that belong to the current week.
- ThisMonth Dates that belong to the current month.
- MonthAfter1 Dates that belong to the following month.
- MonthAfter2 Dates that belong to the month in two-months time.
- MonthAgo1 Dates that belong to the previous month.
- MonthAgo2 Dates that belong to the month two months ago.
- MonthAgo3 Dates that belong to the month three months ago.
- MonthAgo4 Dates that belong to the month four months ago.
- MonthAgo5 Dates that belong to the month five months ago.
- MonthAgo6 Dates that belong to the month six months ago.
- Earlier Dates that belong to the month seven months ago and earlier.

# Expression

An Expression format condition allows you to use complex conditions to apply formatting.

To format values according to the Expression condition, click the menu button of the required data item and select.

### Add Format Rule/Expression

New Column	Count Count Distinct ✓ Sum		
	Min	The second se	Greater Than
		🔀 Value	🕨 📄 Greater Than Or Equal T
	Max	Top/Bottom	Less Than
	Average	🗵 Average	<ul> <li>Less Than Or Equal To</li> </ul>
	More I	Expression	Equal To
	Format	🧬 Icon Ranges	▶
	Add Format Rule	🚽 Color Ranges	Between
	🖏 Edit Rules	💷 Gradient Ranges	Not Between
	🚯 Clear Rules	👍 Bar	[1] Between Or Equal To
	Rename	📴 🛛 Bar Color Ranges	Not Between Or Equal T
		Bar Gradient Ranges	and the second second second second

This invokes the Expression dialog that allows you to specify the required expression. For instance, the following image displays a Grid dashboard item whose rows are filled in green if the Extended Price/Quantity values are greater than 150 000 and 7 500, respectively.

Sales Person	Extended Price	Quantity
Margaret Peacock	\$233K	
Janet Levering	\$203K	
Nancy Davolio	\$192K	
Andrew Fuller	\$167K	
Laura Callahan	\$127K	
Robert King	\$125K	
Anne Dodsworth	\$77.3K	
Michael Suyama	\$73.9K	
Steven Buchanan	\$68.8K	

You can pass static values when creating conditions or pass a dashboard parameter to apply conditional formatting dynamically.

## Bar

The Bar format condition allows you to visualize numeric values using bars. You can also paint bars corresponding to positive and negative values using different colors.

To format values according to the Bar condition, click the menu button of the required data item and select **Add Format Rule | Bar**.

New Column	Count Count Distinct ✓ Sum	
	Min Max Average More Format	Image: Second secon
	Add Format Rule       Image: Base of the state of the sta	

This invokes the Bar dialog that allows you to specify the required settings. For instance, the following image displays a Grid dashboard item whose E xten ded Price cell contains data bars corresponding to numeric values.

Bar			×
Format <i>Extended</i> conditions	<i>Price vs Avg</i> va	lues using bar	
Min =	0	Automatic	Ŧ
Max =	0	Automatic	Ŧ
Style Settings	Negative Sty	le Settings	
Custom Appe	arance		
Apply to			
Extended Price v	s Avg		Ŧ
<ul> <li>Allow negative</li> <li>Draw axis</li> <li>Show bar only</li> </ul>			
	ОК Са	ancel App	У

Sales Person	Extended Price vs Avg
Margaret Peacock	\$92.2K
Janet Leverling	\$62.2K
Nancy Davolio	\$51.5K
Andrew Fuller	\$25.9K
Laura Callahan	(\$13.8K)
Robert King	(\$16.1K)
Anne Dodsworth	(\$63.3K)
Michael Suyama	(\$66.7K)
Steven Buchanan	(\$71.9K)

This dialog allows you to change the following options specific to the Bar format condition:

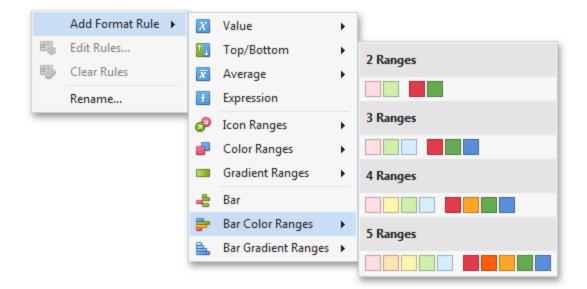

By default, lengths of the shortest and longest bars correspond to minimum and maximum values, respectively. If necessary, you can specify values corresponding to the shortest and longest bars manually. To do this, change the type of minimum/maximum value from Automatic to Number or Percent, and specify the required values.

- Style Settings and Negative Style Settings allow you to specify style settings used to color data bars corresponding to positive and negative values, respectively. To learn how to specify custom style settings, see the Specify Appearance Settings paragraph in the Conditional Formatting topic.
- The **Allow negative axis** option allows you to specify whether negative data bars are displayed in the direction opposite to the positive data bars.
- The **Draw axis** option specifies whether to draw the vertical axis between positive and negative data bars.
- The Show bar only option specifies whether to show bars without corresponding values.

### **Bar Color Ranges**

Bar Color Ranges allow you to visualize numeric values using bars whose colors are contained in the specified color set.

To format values according the required condition, click the data item menu button, select Add Format Rule | Bar Color Ranges and choose the required color set.

This invokes the **Color Range Bar** dialog containing the set of value ranges and corresponding colors. The Grid dashboard item on the right displays the default formatting applied using the predefined set of 3 colors.

Color Range Bar ×

Nancy Davolio		\$192K
Andrew Fuller		\$167K
Laura Callahan		\$127K
Robert King		\$125K
Anne Dodsworth		\$77.3K
Michael Suyama		\$73.9K
Steven Buchanan		\$68.8K

This dialog allows you to change the following options specific to Bar Color Ranges.

- The Format Style combo box allows you to change the color set used to apply formatting.
- The Use % ranges check box specifies whether the percent or absolute scale is used to generate ranges.

Note that this option is not available for numeric dimensions.

To change the appearance settings applied to values corresponding to the specified range, click the button next to the required color and select a new color or specify custom appearance settings.

	100.00 %	>=	<b>67.00</b> %
-	67.00 %	>=	33.00 %
	No St	tyle	
Custom	Appearance		

Select No Style to disable the indication for the required range.

You can change range boundaries by specifying the required values.

<b>100.00</b> %	>=	<b>67.00</b> %
80.00%	>=	33.00 %
33.00 %	>=	0.00 %

Note that a new value should fall into a range between corresponding values of the previous and next range.

To change the comparison logic for the required range, click the comparison sign and select the required option.

33.00 %
= 0.00 %

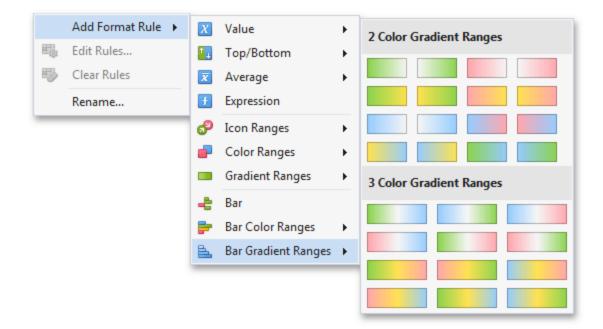

The greater or equal sign includes the smallest value for the current interval, while the greater sign excludes the smallest value from the current interval and includes it in the next interval.

Use the Add and Delete buttons to add new ranges or delete the selected range respectively.

### **Bar Gradient Ranges**

The Bar Gradient Ranges allow you to visualize numeric values using bars whose colors are contained in the specified color gradient.

To format values according the required condition, click the measure menu button, select Add Format Rule | Bar Gradient Ranges and choose the required color gradient.

#### **Appearance Customization**

This invokes the Bar Gradient Ranges dialog containing the set of value ranges and corresponding appearance settings. The Grid dashboard item on the right displays the default formatting applied using the predefined Red- Blue gradient.

Michael Suyama		\$73.9K
Steven Buchanan		\$68.8K

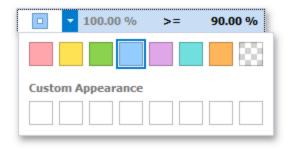

This dialog allows you to change the following options specific to Bar Gradient Ranges.

• **Number of ranges** allows you to specify the number of ranges used to classify values. Click the

• **Generate Ranges** button to generate a new gradient scale according to the specified number of ranges. The Use % ranges check box specifies whether the percent or absolute scale is used to generate ranges.

Note that this option is not available for numeric dimensions.

To change the specific color in the gradient, click the button next to the required color and select a new color or specify a custom background color. This allows you to create a color gradient based on more than two colors. In this case, the specified colors are marked with an empty square.

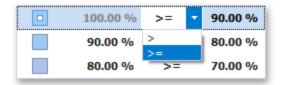

You can change range boundaries by specifying the required values.

100.00 %	>=	85.00 %
<b>85.00</b> %	>=	80.00 %
80.00 %	>=	70.00 %

Note that a new value should fall into a range between corresponding values of the previous and next range.

To change the comparison logic for the required range, click the comparison sign and select the required option.

The greater or equal sign includes the smallest value in the current interval while the greater sign excludes the smallest value from the current interval and includes it in the next interval.

# Coloring

The Dashboard Designer provides the capability to manage coloring of dashboard item elements. You can choose whether to use a global color scheme providing consistent colors for identical values across the dashboard or a local color scheme that provides an independent set of colors for each dashboard item. The Dashboard Designer also allows you to edit colors automatically assigned from the default palette.

## **Coloring Concepts**

The Dashboard Designer provides you with the capability to color dashboard item elements by associating dimension values/measures and specified colors. You can choose whether to use a global color scheme to provide consistent colors for identical values or specify a local color scheme for each dashboard item.

### **Supported Dashboard Items**

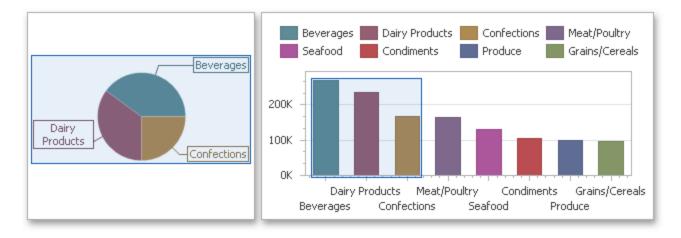

The BI Dashboard allows you to manage coloring for the following dashboard items:

- Chart
- Scatter Chart
- Pie
- Pie Map
- Range
- Filter
- Treemap

### **Color Schemes**

The dashboard provides two ways of coloring dashboard item elements.

Using a global color scheme that provides consistent colors for identical values across the dashboard. The image below shows the dashboard containing Pie and Chart dashboard items. Pie segments and chart series points corresponding to 'Beverages', 'Condiments' and 'Diary Products' dimension values are colored using identical colors from the default palette.

To use global colors for coloring dashboard item elements, click the **Global Colors** button in the Design ribbon tab.

When a global color scheme is used, the dashboard reserves automatically generated colors for certain values regardless of the filter state.

Using a local color scheme that provides an independent set of colors for each dashboard item.

To use local colors for coloring dashboard item elements, click **Local Colors** in the Design ribbon tab.

When a local color scheme is used, the dashboard reassigns palette colors when the filter state is changed.

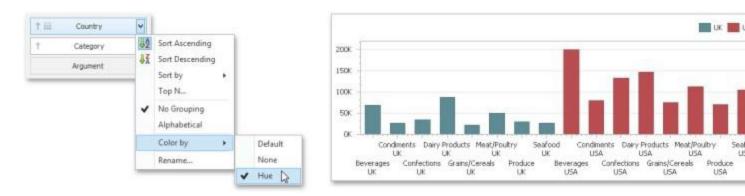

### **Coloring Dimensions and Measures**

Dashboard items allow you to manage the coloring of individual dimensions or all dashboard item measures using predefined coloring modes.

Coloring Mode	Description
Default	Dimension values/measures are colored by default. To learn how specific dashboard items color their elements by default, see the Coloring topic for the corresponding dashboard item.
Hue	Dimension values/measures are colored by hue. If coloring by hue is enabled, a data item indicates this using the indicator.
None	Dimension values/measures are colored with the same color.

### **Coloring Dimension Values**

To specify the coloring mode for the required dimension, click the dimension's menu button and use the **Color by** sub-menu. For instance, the image below shows the Chart dashboard item whose 'Country' dimension is colored by hue.

### **Coloring Measures**

To specify the coloring mode for dashboard item measures, click the menu button of any measure and use the **Color by** sub-menu. For instance, the image below shows the Pie dashboard item whose measures are colored by hue.

111	Sales				Sales	Quantity
111	Quantity		Count	1	Beverages: 40.00 %	Beverag
	Value		Count Distinct			
		1	Min		Daity Products:	Products:
			Max Average		35.02 % Confections: 24.99 %	Confectio
			More +			Treasure
			Format		-	
			Colorby +	Default		
			Rename	None		
			A MARTIN STOLEN	🖌 Hue 🍃		

If you enabled coloring by hue for several dimensions/measures, all combinations of dimension values/measures will be automatically colored using different colors from the default palette.

### **Customizing a Color Scheme**

The Dashboard Designer provides the capability to edit colors contained in global and local color schemes. You can select the required color from the default dashboard palette or specify a custom color.

### Invoke a Color Scheme Dialog

To edit colors, use the Color Scheme dialog. You can invoke this dialog in the following ways:

To edit colors in a global color scheme, use the **Edit Colors** button in the **Home** ribbon tab or the Edit Colors button in the dashboard item's **Design** tab.

To edit colors in a local color scheme, use the **Edit Colors** button in the contextual **Design** ribbon tab.

Global Colors	Local Colors	Edit Colors
	Colorin	g bð

Lets consider a Chart dashboard item whose dimensions and measures are colored by hue using local colors.

For this dashboard item, the Color Scheme dialog will contain combinations of all dimension values and a specific measure.

Local Color Scheme	×
Data Source 1: Category   Country   MeasureNames	✓ Delete New Color Table
Value	Color
Beverages   UK   Quantity (Sum)	Auto
Beverages   UK   Sales (Sum)	Auto
Beverages   USA   Quantity (Sum)	Auto
Beverages   USA   Sales (Sum)	Auto
Confections   UK   Quantity (Sum)	Auto
Confections   UK   Sales (Sum)	Auto
Confections   USA   Quantity (Sum)	Auto
Confections   USA   Sales (Sum)	Auto
Dairy Products   UK   Quantity (Sum)	Auto
Dairy Products   UK   Sales (Sum)	Auto
Dairy Products   USA   Quantity (Sum)	Auto
Dairy Products   USA   Sales (Sum)	Auto
New Value	
	OK Cancel Apply

In this dialog, you can perform the following actions:

- Edit automatically assigned colors or specify new colors.
- Add new values to a color table.
- Add new color tables containing values whose colors are not yet assigned.

### **Edit Colors**

You can customize automatically assigned colors in several ways.

To retain the automatically assigned color for the selected value, right-click the required value in the Value column and select **Retain this color**.

#### **Appearance Customization**

Value	- Color	
Beverages   UK   Quantity (Sum)	Auto	
Beverages   UK   Sales (Sum)	Auto	
Beverages   USA   Quantity (Sum)	Retain this color	
Beverages   USA   Sales (Sum)	Retain all colors	
Confections   UK   Quantity (Sum)	- AULU	
Confections   UK   Sales (Sum)	Auto	

Value 🔺	Color
Beverages   UK   Quantity (Sum)	Auto
Beverages   UK   Sales (Sum)	Palette index: 0
Beverages   USA   Quantity (Sum)	Auto
Beverages   USA   Sales (Sum)	Auto
Confections   UK   Quantity (Sum)	Auto
Confections   UK   Sales (Sum)	Auto

This reserves the current palette color for the selected value.

You can select another palette color by clicking the required cell in the **Color** column.

Value	Color		Value	 Color
Beverages   UK   Quantity (Sum)	Auto		Beverages   UK   Quantity (Sum)	Auto
Beverages   UK   Sales (Sum)	Auto 💙		Beverages   UK   Sales (Sum)	Palette index: 1
Beverages   USA   Quantity (Sum)	Palette Colors		Beverages   USA   Quantity (Sum)	Auto
Beverages   USA   Sales (Sum)		-	Beverages   USA   Sales (Sum)	Auto
Confections   UK   Quantity (Sum)			Confections   UK   Quantity (Sum)	Auto
Confections   UK   Sales (Sum)			Confections   UK   Sales (Sum)	Auto
	1 More Colors		A second contraction of a second second	

To specify a custom color, click **More Colors...** and pick any color using the RGB or HSB color model in the invoked **Select Color dialog**.

RGB Model	HSB Model			
1			Red	206 🗘
			Green	154 🗘
0			Blue	71 🗘
			< Opacity:	255 🗘
Saturation		Luminance	# CE9A47	
			Make W	eb-Safe
		100%		
Opacity		100%		

You can reset the customized color for the selected value using the **Reset** menu item.

Value	▲ Color
Beverages   UK   Quantity (Sum)	Auto
Beverages   UK   Sales (Sum)	Palette index: 1
Beverages   USA   Quantity (Sum)	Reset
Beverages   USA   Sales (Sum)	Reset all
Confections   UK   Quantity (Sum)	AUTO
Confections   UK   Sales (Sum)	Auto

### Add a New Value

The Color Scheme dialog allows you adding a new value with the specified color to the selected color table. To do this, click the **New Value...** button.

#### **Appearance Customization**

New Value	×
Category: Seafood Country: USA	
Measures:	
🔺 🧮 Data Source 1	Sales (Sum)
⊿ 📰 SalesPerson	>
ab Category	
ab Country	<
ab Sales Person	
123 Quantity	
1,2 Sales	
	Summary type: Sum 🗸
	OK Cancel

In the invoked New Value dialog, specify the dimension values, add the required measures and click **OK**. This creates a new value whose color can be specified as described in **Edit Colors**.

You can remove manually added values using the **Remove** context menu item.

Dairy Products   USA   Sales (Sum)	Auto
Seafood   USA   Sales (Sum)	Palette index: 8
R	emove

### Add a New Color Table

The Color Scheme dialog also allows you to add a new color table containing values whose colors are not yet assigned. To do this, click **New Color Table...** button.

New Color Table				x
Data source: Data Source 1 🗸				
Data Source 1     SalesPerson     Category	>	Sales Person Country		
ab Country ab Sales Person 123 Quantity 1,2 Sales	<			
		Text group interval: Date-time group interval:	No Grouping Year	>
		MeasureNames' Dimensi	on	
			OK Cance	9

In the invoked dialog, specify the data source, add the required dimensions and enable the 'MeasureNames' Dimension check-box if you need to add measures to a color table.

Click **OK** to add the color table to a color scheme. Then, you can add values to this table (see Add a New Value) and specify its colors (see Edit Colors).

# **Data Analysis**

This section describes how to perform advanced data analysis using the aggregate and window functions, dashboard parameters, etc.

# Aggregations

Topics in this section describe functions used to introduce additional aggregation levels to prepare underlying data.

### **Summary Level Aggregations**

The BI Dashboard Designer allows you to perform aggregations when constructing a calculated field expression. This allows you to evaluate calculated fields on a summary level.

In the BI Dashboard Designer, you can use the following set of predefined aggregate functions.

Expre	ession Editor					×
SU	M([Profit])/	SUM([Revenue])				~
						~
⊿ Fu	unctions	Enter text to search	Q	Sum(	(Value)	receien
	Aggregate	Aggr	^	value	rns the sum of all the exp es in the collection.	ression
	DateTime	Avg				
	Logical	Count				
	Math	CountDistinct				
	String	Max				
0	perators	Median				
	olumns	StdDev				
Co	onstants	StdDevp				
Pa	arameters	Sum	)			
		Var	$\sim$			
					OK Ca	ncel

Function	Description
Aggr	Aggregates underlying data using the detail level specified by a
· · · ·	predefined set of dimensions and a specified summary function. To learn
Dimensions)	more, see Intermediate Level Aggregations.
Avg(Value)	Returnstheaverageofallthevaluesinthe expression.
Count()	Returnsthenumberofvalues.
CountDistinct(Value)	Returnsthenumberofdistinct values.
Max(Value)	Returnsthemaximumvalueacrossall records.
Min(Value)	Returnstheminimumvalueacrossallrecords.
Median(Value)	Returnsthemedianofthevalues.
Sum(Value)	Returnsthesumofall values.
Var(Value)	Returns an estimate of the variance of a population where the sample is a subset of the entire population.

Varp(Value) Returns the variance of a population where the population isthe entire data to besummarized.

StdDev	Returns an estimate of the standard deviation of a
(Value)	populationwherethesampleisasubsetoftheentire population.
StdDevp	Returns the standard deviation of a population where the population is the entire
(Value)	data to besummarized.

These functions can be used for all types of numeric fields

### **Intermediate Level Aggregations**

The Dashboard can aggregate and summarize data on different levels.

- The **Query Builder** allows you to prepare an underlying data source before analyzing data. You can apply grouping, sorting, summarization and other data shaping operations during data selection.
- Dashboard items aggregate and summarize data at a visualization level using dimensions and measures, respectively.
- The **Aggr function** allows you to introduce an intermediate detail level that is not related to the visualization level. This allows you to create custom aggregations at different levels and combine these aggregations with existing visualizations.

The Aggr function aggregates and summarizes underlying data using the detail level specified by a predefined set of dimensions and a specified summary function. This function can be used during the creation of a new calculated field in the Expression Editor.

The Aggr function has the following syntax:

C#

Aggr(summaryExpression,dimension1,dimension2,...)

The first argument is a summary expression calculated against a specific data source field. The next arguments are the set of dimensions whose values are aggregated and used to calculate summaries specified using the first argument. For instance, the following function calculates sums of sales for each product within the specified category.

C#

Aggr(Sum([Sales]),[Category],[Product])

If you created the calculated field that includes the Aggr function and dropped the created field into an existing dashboard item, the Dashboard joins the resulting aggregation with the already displayed data. This means that you can add data with the increased or decreased granularity to the dashboard item. There are two main scenarios.

In the first scenario, an aggregation has a less detailed granularity than visualized data.

In this scenario, an underlying data source contains the list of orders for two categories and corresponding products.

Order ID	Category	Product	Sales
1	Beverages	Chai	10
2	Beverages	Chai	15
3	Beverages	Coffee	35
4	Beverages	Coffee	20
5	Confections	Chocolate	40
6	Confections	Chocolate	55
7	Confections	Biscuits	25
8	Confections	Biscuits	35

To aggregate this data by individual categories, create a calculated field with the following expression.

#### C#

```
Aggr(Sum([Sales]),[Category])
```

The following internal table will be generated for this calculated field.

Order ID	Category	Product	Sales
1	Beverages	Chai	10
2	Beverages	Chai	15
3	Beverages	Coffee	35
4	Beverages	Coffee	20
5	Confections	Chocolate	40
6	Confections	Chocolate	55
7	Confections	Biscuits	25
8	Confections	Biscuits	35

The sample <u>Grid</u> dashboard item contains more detailed data and includes the following columns: Category, Product, and the sum of Sales.

Category	Product	Sales (Sum)
Beverages	Chai	\$25
Beverages	Coffee	\$55
Confections	Biscuits	\$60
Confections	Chocolate	\$95

If you drop the created calculated field to the Grid, the sum of sales for each category will be repeated for each Grid row.

Category	Product	Sales (Sum)						
Beverages	Chai		\$25					
Beverages	Coffee		\$55			1	1	
Confections	Biscuits		\$60		Category	Product	Sales (Sum)	Sales by Category (Sur
Confections	Chocolate		\$95	-	Beverages	Chai	\$25	
					Beverages	Coffee	\$55	
					Confections	Biscuits	\$60	
					Confections	Chocolate	\$95	
	Beverages	80						
	Confections	155						

For instance, you can use these values later to calculate a contribution of each product to a categorys sales.

An aggregation has a more detailed granularity than visualized data.

To aggregate this data by categories and products, create a calculated field with the following expression.

#### C#

```
Aggr(Sum([Sales]),[Category],[Product])
```

The following internal table will be generated for this calculated field.

Order ID	Category	Product	Sales
1	Beverages	Chai	10
2	Beverages	Chai	15
3	Beverages	Coffee	35
4	Beverages	Coffee	20
5	Confections	Chocolate	40
6	Confections	Chocolate	55
7	Confections	Biscuits	25
8	Confections	Biscuits	35

,	Beverages	Chai	
	Beverages	Coffee	
	Confections	Biscuits	
	Confections	Chocolate	

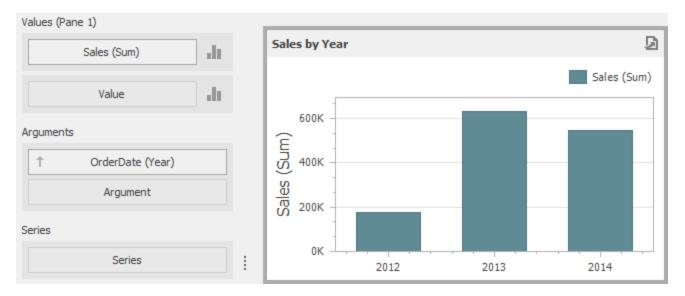

Drop the created calculated field to the Grid and set its summary type to **Min**. The Grid will display minimum product sales within each category.

Category		Sales (Sum)				
Beverages			\$80			
Confections		\$155			1	
				Category	Sales (Sum)	Sales by Product (Min)
				Bauaraaaa	\$80	
				Beverages	200	
	1	Summary typ	pe = Min	Confections	\$155	
Beverages	Chai		pe = Min 25			
Beverages Beverages Confections	Chai		25			

### Example 1: Best/Worst Sales by Year

The following example shows how to display best and worst monthly sales for each year.

In this example, the Chart dashboard item shows the sum of sales by different years. The Sales field is placed in the Values section and the OrderD ate (with the Year group interval) is placed in the Arguments section.

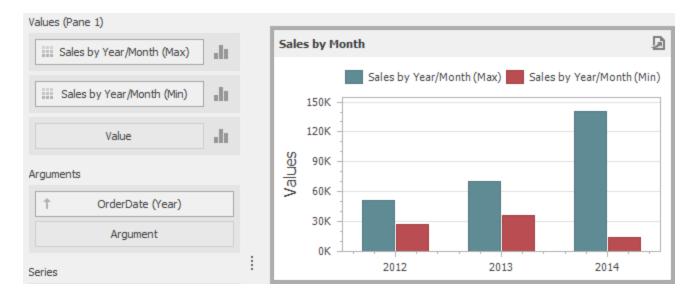

To display sales by the best/worst months for each year, create a new calculated field with the following expression.

C#

Aggr(Sum([Sales]),GetYear([OrderDate]),GetMonth([OrderDate]))

Drop this field (Sales by Year/M on th in the image below) to the Values section and set its summary type to **Max**. Then, drop this field to Values again and set its summary type to Min. The Chart will visualize sales by the best/ worst months in a year.

### **Example 2: Percent of Total**

This example will demonstrate how to calculate a contribution of individual quarter sales to year sales.

In this example, the Pivot dashboard item displays the sum of sales by year/quarter. The Sales field is placed in the Values section and the hierarchy of OrderD ate fields (with the Year and Quarter group intervals) is placed in Rows.

Sales (Sum)		Sa	Sales by Year/Quarter						
Sales (Sulli)				Sales (Sum) T	otal				
Value		4	2012 Total	\$	\$175K				
			Q3	\$	56.8K				
olumns			Q4	\$	\$119K				
Column		4	2013 Total	\$	632K				
			Q1	\$	\$159K				
ows			Q2	\$	\$153K				
OrderDate (Year)			Q3	\$	\$145K				
OrderDate (Year)			Q4	\$	\$176K				
OrderDate (Quarter)		4	2014 Total	\$	547K				
Row			Q1	\$	283K				
			Q2	\$	\$264K				
		Gra	and Total	\$1	L.35M				

To calculate a contribution of each quarter to a year sales, do the following:

- 1. Calculate totals for each year using the Aggr function by creating the following calculated field.
- 2. C#

Aggr(Sum([Sales]),GetYear([OrderDate]))

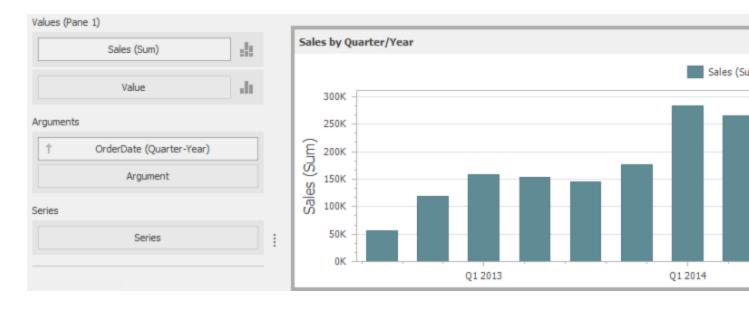

- 3. Set the name of the created field to **Sales by Year**.
- 4. Calculate a contribution of each quarter to year sales by creating the following calculated field.
- 5. C# Sum([Sales])/Max([SalesbyYear])
- 6. Name this field Percent of Total and drop it to Values to see the result.

Sales (Sum)		Sales by Year/Qu	Jarter		
	-				
Percent of Total			Sales (Sum)	Percent of Total	
Value		⊿ 2012 Total	\$175K	100.00 %	
		Q3	\$56.8K	32.39 %	
olumns		Q4	\$119K	67.61 %	
		⊿ 2013 Total	\$632K	100.00 %	
Column		Q1	\$159K	25.14 %	
		Q2	\$153K	24.14 %	
OWS	_	Q3	\$145K	22.87 %	
↑ OrderDate (Year)		Q4	\$176K	27.85 %	
	=	⊿ 2014 Total	\$547K	100.00 %	
OrderDate (Quarter)		Q1	\$283K	51.69 %	
Row		Q2	\$264K	48.31 %	
		Grand Total	\$1.35M	214.36 %	

### **Example 3: Customer Acquisition**

In this example, a customer acquisition will be evaluated by grouping customers by the quarter/year of their first purchase to compare sales contributions.

The Chart dashboard item below visualizes sales by quarter/year.

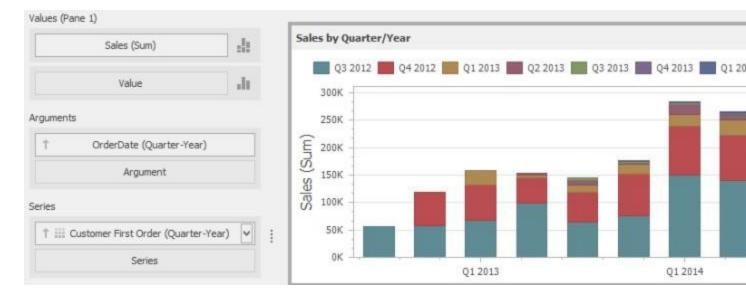

#### **Data Analysis**

The following expression determines the minimum order date (the first purchase date) per customer.

#### C#

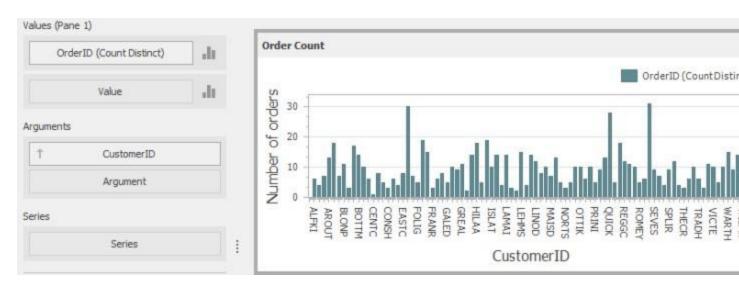

Aggr(Min(GetDateQuarterYear([OrderDate])),[CustomerID])

Set the name of the created field to **Customer First Order** and drop this field to the Series section to see the result.

### **Example 4: Customer Order Count**

In this example, you will learn how to divide customers count by the number of orders they made. The Chart below shows the number of orders that is made by each customer.

The calculated field below evaluates the number of unique orders made by each customer.

#### C#

Aggr(CountDistinct([OrderID]),[CustomerID])

Set the name of this field to **Customer Order Coun**t and drop this field to arguments. Then, drop the CustomerID field to Values and change its summary type to **Count Distinct**.

The Chart will show the number of customers that made a specific number of orders.

### **Example 5: Best Product Sales by Year**

This scenario requires the use of nested aggregations. In this example, the dashboard will show products with the best sales in a year along with sales values.

The initial Grid dashboard item shows sales of all products by year (the OrderD ate column with the Year group interval and the Sales column). The data source also contains the Product Name field.

Sales by Year		B
OrderDate (Year)	Sales (Sum)	
2012		\$175K
2013		\$632K
2014		\$547K
	OrderDate (Year) 2012 2013 2014	OrderDate (Year)Sales (Sum)201220132014-

To implement this scenario, perform the following steps.

Create the calculated field that will return product sales for individual years.

C#

Aggr(Sum([Sales]),GetYear([OrderDate]),[ProductName])

Set its name to **Product Sales by Year**.

Create the calculated field that will return maximum sales values.

C#

Aggr(Max([ProductSalesbyYear]),GetYear([OrderDate]))

Set its name to Max Product Sales by Year.

Finally, create a calculated field returning the name of the product with the best sales and a corresponding sales value.

#### C#

lif([MaxProductSalesbyYear]=[ProductSalesbyYear],[ProductName]+'(\$'+[ProductSa

Specify the name as **Best Sales Product**. Then, drop this field to the Columns section to see the result.

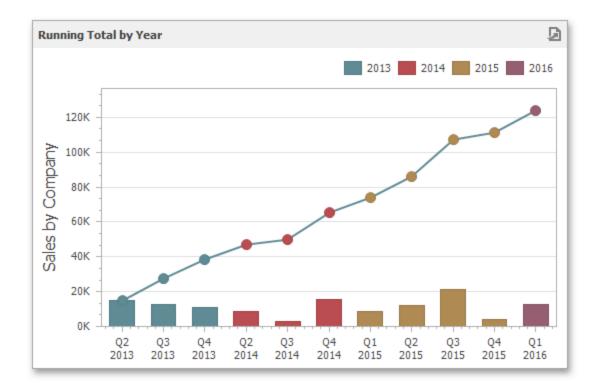

Columns						_		
OrderDate (Year)		Best Sales	Best Sales Products					
		OrderDate (	Year)	Sales (Sum)	Best Sales Product (Max)			
Sales (Sum)	Σ	2012		\$175K	Côte de Blaye (\$ 21080.0)			
Sales (Sully		2013		\$632K	Côte de Blaye (\$ 56441.7)			
Dept Color Deptwet (Max)	2	2014		\$547K	Côte de Blaye (\$ 72462.5)			
Best Sales Product (Max)	$\sum$					- 1		
New Column	A

# **Window Calculations**

Window calculations provide the capability to apply specific computations to measure values and allow you to perform different analytical tasks such as to compute running totals, percentages of totals, differences, etc.

Window calculations provide the capability to apply specific computations to measure values and allow you to perform different analytical tasks such as to compute running totals, percentages of totals, differences, etc.

#### **Data Analysis**

The Dashboard Designer allows you to apply window calculations to values of the specified measure. The following calculation types are supported:

Running Total: Allows you to calculate a cumulative total for a set of measure values.

Sales	Running Total	
10	10	
20	30	20+10
25	55	25+20+10
25	80	25+25+20+10
20	100	20+25+25+20+10

**Moving Calculation**: Allows you to apply a moving calculation, which uses neighboring values to calculate a total. Note that neighboring values are specified using offsets from the currently processed value.

#### **Data Analysis**

Sales	Moving	StartOffset=-1; EndOffset=1
10	30	0+10+20
20	55	10+20+25
25	70	20+25+25
25	70	25+25+20
20	45	25+20+0

Difference: Allows you to compute differences between measure values.

Sales	Difference		
10			
20		10	20-10
25		5	25-20
25		0	25-25
20		-5	20-25

Percent of Total: Allows you to calculate a contribution of individual measure values to a total.

Sales	Percent	
10	10.00 %	10/100*100%
20	20.00 %	20/100*100%
25	25.00 %	25/100*100%
25	25.00 %	25/100*100%
20	20.00 %	20/100*100%

Rank: Allows you to rank values of the specified measure.

Sales	Rank	Competition rank
10	1	10 20 20 25 25
20	2	12244
25	4	
25	4	
20	2	

Note that the computing of calculations depends on two factors:

- The type of the dashboard item. In this case, you need to specify a calculation direction that depends on the dashboard item type. For instance, the Pivot dashboard item provides the capability to apply calculations along with its columns or rows.
- The set of dimensions that are used to calculate measure values. In this case, a calculation direction depends on the dimensions' order.

In both cases, measure values participating in a calculation fall into a specified window.

### **Dashboard Item Window Definition**

The following table lists window definitions in terms of the Pivot dashboard item. A calculation is performed using the Index function along the following directions.

Direct ion	Descrip tion	Example								Exan Desc	nple ription

\***Group**: An area that is limited by a set of values corresponding to the bottommost partitioning dimensions.

### **Specific Window Definition**

If necessary, you can manually specify the set of dimensions that fall into the window. These dimensions are called window dimensions.

For instance, the Index function is applied to measure values of the pivot table below using the Order Date (Year) and Country window dimensions.

			15		<b>⊿</b> 2016				
		Q1		Q2	Q3		Q4	Q1	Q2
⊿ UK	Beverages		1	1		1	1	3	3
	Condiments		1	1		1	1	3	3
	Confections		1	1		1	1	- 3	3
⊿ USA	Beverages		2	2		2	2	4	4
	Condiments		2	2		2	2	4	4
	Confections		2	2		2	2	4	4

The Specific Window Definition dialog allows you to do this.

Specific Window Definition		×
Partitioning Dimensions: OrderDate (Quarter) CategoryName	Window Dimensions:	
	OK	Cancel

### **Creating Window Calculations**

The Dashboard Designer allows you to add a window calculation for numeric measures. To do this, invoke the data item menu and select the required calculation type.

The image above shows a calculation menu of the Pivot dashboard item. The following items are available:

- **Percent of Column Grand Total**: Calculates a contribution of individual measure values to a column grand total.
- **Percent of Row Grand Total**: Calculates a contribution of individual measure values to a row grand total.

- **Percent of Grand Total**: Calculates a contribution of individual measure values to a grand total.
- Running Summary along Columns: Calculates a cumulative total for measure values along columns (horizontally).
- **Running Summary along Rows**: Calculates a cumulative total for measure values along rows (vertically).
- **Difference along Columns**: Calculates differences between measure values along columns (horizontally).
- **Difference along Rows**: Calculates differences between measure values along rows (vertically).
- **Percent Difference along Columns**: Calculates percentage differences between measure values along columns (horizontally).
- Percent Difference along Rows: Calculates percentage differences between measure values along rows (vertically).
- Rank along Columns: Ranks measure values along columns (horizontally).
- Rank along Rows: Ranks measure values along rows (vertically).
- Rank along Cells: Ranks measure values along cells (throughout the entire pivot table).
- **Custom...**: Allows you to create a custom calculation by specifying various settings. Clicking this invokes the Customize Calculation dialog that allows you to add additional customizations to

Customize Calculation		×
Calculation Type: None Running Total Moving Calculation Difference Percent Of Total Rank Expression	The current measure has no calculation applied	
	OK Cancel A	Apply

Note that the list of available items in this menu can be changed by the Dashboard Designer dynamically. For instance, if the Pivot dashboard item does not contain dimensions in the Rows section, menu items related to rows will be disabled.

### **Running Total**

The Running Total calculation can be used to compute a cumulative total for the specified measure across a <u>window</u>. For example, the Grid below displays cumulative sales across all quarters.

Order Year	Order Quarter	Sales	Running Total
	Q1	\$138K	\$138K
2015	Q2	\$143K	\$281K
2015	Q3	\$154K	\$435K
	Q4	\$182K	\$617K
2016	Q1	\$298K	\$916K
2010	Q2	\$142K	\$1.06M

The Customize Calculation dialog provides the following settings for the Running Total calculation.

Customize Calculation				×
Calculation Type: None Running Total Moving Calculation Difference Percent Of Total Rank Expression	Running along: Summary function:	Rows Sum		<b>▼</b>
	RunningSum(Sum([S			<
	Edit in Expression	OK	Cancel	Apply

Running along: Specifies a window and direction used to calculate running totals.

**Summary function**: Specifies a summary function used to apply calculation. To learn more about the available summary functions, see the Summary Function Types in the summary function topic.

### **Moving Calculation**

The Moving calculation uses neighboring values to calculate a total. For example, the Grid below shows a moving average across all quarters.

#### **Data Analysis**

Order Year	Order Quarter	Sales	Moving Average
	Q1	\$138K	\$138K
2015	Q2	\$143K	\$141K
2015	Q3	\$154K	\$145K
	Q4	\$182K	\$160K
2016	Q1	\$298K	\$211K
2010	Q2	\$142K	\$20 <i>7</i> K

The Customize Calculation dialog provides the following settings for the Moving calculation.

Customize Calculation			$\times$
Calculation Type:			
None	Moving along:	Rows	-
Running Total Moving Calculation	Summary function:	Sum	•
Difference	Start offset:	2	*
Percent Of Total Rank	End offset:	0	*
Expression			<u> </u>
	Window Com (Com (IC	-[]) 2.0)	
	WindowSum(Sum([Sa	ales]), -2, 0)	^
			~
	Edit in Expression	n Editor	_
		OK Cancel Apply	

Moving along: Specifies a window and direction used to apply a calculation.

**Summary function**: Specifies a summary function used to apply a calculation. To learn more about the available summary functions, see the Summary Function Types in the summary function topic.

**Start offset / End offset**: Specify start/end offsets from the currently processed value. For instance, if you specified offsets as 1/1, the previous and next values will be used along with the current value to apply the Moving calculation.

#### Difference

The Difference calculation can be used to compute the difference between measure values across a window. For example, the Grid below shows absolute differences between quarterly sales.

Order Year	Order Quarter	Sales	Difference
	Q1	\$138K	
2015	Q2	\$143K	\$4.89K
2015	Q3	\$154K	\$10.8K
	Q4	\$182K	\$27.7K
2016	Q1	\$298K	\$117K
2010	Q2	\$142K	(\$156K)

The Customize Calculation dialog provides the following settings for the Difference calculation.

Customize Calculation			$\times$
Calculation Type:			
None	Calculate along:	Rows	-
Running Total Moving Calculation	Difference from:	Previous	-
Difference Percent Of Total Rank Expression		Percentage Difference	
	Sum([Sales]) - Look	up(Sum([Sales]), -1)	< >
	Edit in Expressi	on Editor	
	[	OK Cancel Appl	у

Calculate along: Specifies a window and direction used to calculate differences.

**Difference from**: Specifies the value used to calculate the difference. The following values are available: Previous, Next, First and Last.

You can also use the Percent Difference option to specify whether the absolute or percentage difference is displayed.

#### **Percent of Total**

A calculation is used to compute a percentage of the total for the specified measure across a window. For example, the Grid below shows a contribution of individual quarterly sales to total sales.

Order Year	Order Quarter	Sales	Percent of Total
	Q1	\$138K	13.07 %
2015	Q2	\$143K	13.54 %
2015	Q3	\$154K	14.55 %
	Q4	\$182K	17.18 %
2016	Q1	\$298K	28.22 %
2010	Q2	\$142K	13.44 %

The Customize Calculation dialog provides the following settings for the Percent of Total calculation.

Customize Calculation		×
Calculation Type:		
None Running Total Moving Calculation Difference Percent Of Total Rank Expression	Percent of total by: Rows	T
	ToDouble(Sum([Sales])) / Total(Sum([Sales]))	< >
	Edit in Expression Editor	
	OK Cancel Ap	ply

Percent of Total: Specifies a window and direction used to apply a Percent of Total calculation.

#### Rank

Use the Rank calculation to compute rankings for the specified measure across a window. For example, the Grid below shows a ranking of sales for individual quarters.

#### **Data Analysis**

Order Year	Order Quarter	Sales	Rank
	Q1	\$138K	6
2015	Q2	\$143K	4
2015	Q3	\$154K	3
	Q4	\$182K	2
2016	Q1	\$298K	1
2010	Q2	\$142K	5

The Customize Calculation dialog provides the following settings for the Rank calculation.

Customize Calculation			$\times$
Calculation Type:			
None	Rank along:	Rows	-
Running Total Moving Calculation Difference	Rank type:	Competition	*
Percent Of Total Rank Expression	Order:	<ul> <li>Ascending</li> <li>Descending</li> </ul>	
	RankCompetition	n(Sum([Sales]), 'asc')	^
			$\sim$
	Edit in Expre	ssion Editor	
		OK Cancel Apply	/

Rank along: Specifies a window and direction used to rank values.

**Rank type**: Specifies the type of ranking. The following rank types are available: Uniqu e, Com petition, Den s e, Modified and Percen tile.

Order: Specifies the order of ranking. You can select Ascending or Descending.

#### Expression

Use Expression to specify a custom calculation by adding the required calculation functions inside the measure expression.

Customize Calculation			×	
Calculation Type:				
None Running Total	Calculate along:	Rows	-	
Moving Calculation Difference Percent Of Total Rank Expression	Sum([Sales])		^	
	Edit in Expressio	n Editor	~	
		OK Car	Apply	

Click the **Edit in Expression Editor** button to invoke the Expression Editor and specify the required expression.

Expression Editor			×
<pre>Sum([Sales])</pre>			^
			~
▲ Functions	Enter text to search	Q	First()
Aggregate	First	^	Returns the number of rows from the current row to the first row in the
DateTime	Index		window.
Logical	Last		
Math	Lookup		
String	RankCompetition RankDense		
Window	RankDense		
Operators	RankPercentile		
Columns	RankUnique		
Constants	RunningAvg		
	RunningCount	~	
			OK Cancel
			Cancer

The Expression type provides the Calculate along option that specifies the window and direction used to calculate differences. Note that this option is in effect if the expression contains a calculation function.

### **Calculation Functions Reference**

Note that window functions cannot be used inside Aggr.

### **Window Calculation Limitations**

#### **Supported Dashboard Items**

Window calculations can be applied to measures of the following dashboard items:

- Chart
- Grid
- Pies
- Cards
- Gauges

- Pivot
- Range Filter

#### **Data Shaping Limitations**

The use of calculations imposes the following limitations related to data shaping features.

- Sorting by measure cannot be applied if the target measure has a calculation applied.
- Top N cannot be applied if its target measure has a calculation.

## **Using Dashboard Parameters**

You can use dashboard parameters when it is necessary to pass data of a certain type to a dashboard (e.g., to pass a specific value to the data source filter string or a calculated field).

### **Creating Parameters**

This topic explains how to create a new dashboard parameter and specify its settings.

#### **Creating Parameters in the Dashboard Designer**

To create dashboard parameters in the Dashboard Designer, do the following:

1. Click the Parameters button on the Ribbon's Data Source tab.

2. In the invoked dialog, click the Add button to add a new parameter.

Parameters		
Parameter 1	2↓	
	General	~
	Visible	Yes
	Allow Null	No
	Allow Multiselect	No
	Name	Parameter1
	Data	~
	Description	
	Look-Up Settings	No Look-Up
	Select All Values	No
	Туре	String
	Value	
Add Remove +		
		OK Cancel

- 3. Specify the following settings:
  - **Visible**: Specifies whether or not the parameter editor is visible in the Dashboard Parameters dialog.
  - Allow Null: Specifies whether or a not null value can be passed as a parameter value.
  - Allow Multiselect: Specifies whether or not multi-selection is enabled for the current parameter. The following limitations are applied to parameters with multi-selection enabled.
  - Use the **is any of** or **is none of** operators to pass a multi-select parameter to a filter criteria or to the Expression format condition.

- Use the In or Not In operators to pass a multi-select parameter to a calculated field expression. Stored procedures used in the SQL data source do not support multiselect parameters.
- **Name**: Specifies the parameter name. When creating and modifying parameter names, follow the rules below.
  - A name can contain letters, numbers and underscores.
    - A name cannot contain spaces.

A name cannot be an empty string.

- The dashboard cannot contain parameters with the same name.
- Names are case-sensitive. For example, you can create the names Parameter and PARAMETER.
- **Description**: Specifies the parameter's description. The parameter's description is the value displayed in the Parameter Name column of the Dashboard Parameters dialog.
- Look-Up Settings: Specifies the parameter's look-up editor settings.
- **Select All Values**: Specifies whether or not all parameter values should be selected in the initial state of the Dashboard Viewer.
  - Note that this option is in effect when Allow Multiselect is set to true.
- **Type**: Specifies the parameter type.
- Value: Specifies the default parameters value. Note that when Allow Multiselect is set to true, the
  - Value option allows you to select multiple parameter values. Then, click OK to add the created parameters to the dashboard.

#### Look-Up Editor Settings

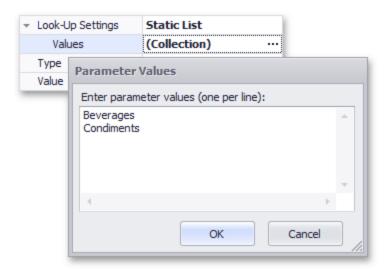

There are three types of look-up editor settings that can be specified for a parameter. Select the required type from the Look-UpSettings drop-down list.

Descrip	otion		
Look-U	lp Settings	No Look-Up	-
Type	No Look-Up		
Value	Static List		
Select	Dynamic List		
_			//.

No Look-Up: Set the Value to use a static value as a parameter.

Look-Up Settings	No Look-Up
Туре	String
Value	Beverages

Static List: Click the ellipsis button to add static values for the current dashboard parameter.

In this case, the Value specifies the default parameter's value.

**Dynamic List**: Allows you to use a list of values from the existing data source as a parameter. You need to select the required Data Source from the list of available data sources and data members for the dashboard parameter's display name and value, respectively.

	Dynamic List
Data Source	SQL Data Source 1
Data Member	Categories
Value Member	CategoryID
Display Member	CategoryName
Sort By	
Sort Order	Ascending
Туре	String
Value	1

- 1. First, select the required **Data Source** from the list of available data sources. For the SQL data source, select the required **Data Member** that specifies the query from the selected Data Source.
- 2. Then, specify data members for the dashboard parameter's value and display name using **Value Member** and **Display Member**, respectively.
- 3. If necessary, specify the data member used to sort parameter values using the **Sort By** option. **Sort Order** specifies the required sort order.

### **Passing Parameter Values**

In this topic, you will learn how to pass parameter values to a dashboard.

#### Filtering

You can filter the specified query or apply filtering to a specific dashboard item according to the current parameter value(s) using the Filter Editor.

In the Filter Editor, you can compare a field value with the following objects:

- Another field value (represented by 
  the icon). Click this button to switch to the next item mode (parameter value), to compare the field value with a parameter value.

• A parameter value (represented by 
the icon). Click this button to switch back to the initial mode ("static value"), to compare the field value with a static value.

Thus, to compare a field value with a parameter value, click the Ø button, then click the Ø button.

Filter Editor	x
And  C SalesPerson.OrderDate] Is greater than or equal to ?fromDate [SalesPerson.OrderDate] Is less than or equal to ?toDate toDate fromDate Add a	
ОК С	ancel Apply

#### **Calculated Fields**

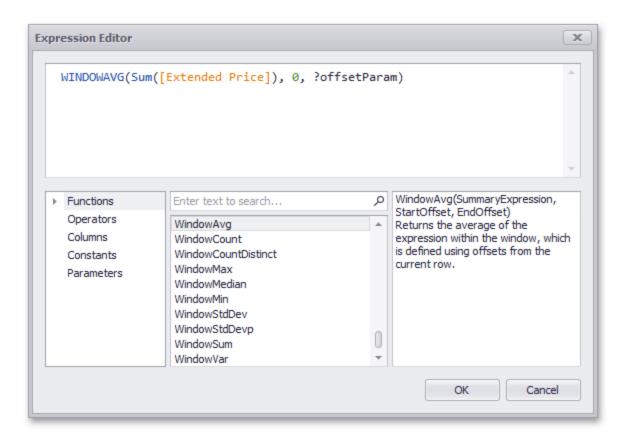

You can use parameters when constructing expressions for calculated fields. This allows you to dynamically evaluate values of the calculated field depending on the current parameter value.

To include the required parameter in the calculated field expression, click Parameters in the Expression Editor dialog and double-click the required parameter.

Expression Editor		x
[UnitPrice] *	(1 - ?seasonDiscount)	
		-
<ul> <li>Functions</li> <li>Operators</li> <li>Columns</li> <li>Constants</li> <li>Parameters</li> </ul>		Decimal
	] 1	OK Cancel

### **Window Calculations**

You can use parameters when customizing expressions for window calculations. This allows you to apply a calculation dynamically, depending on the current parameter value.

#### **Requesting Parameter Values**

The BI Dashboard provides a built-in Dashboard Parameters dialog, which provides the capability to change dashboard parameter values. This dialog is created automatically, depending on the parameter type and visibility settings.

To invoke the Dashboard Parameters dialog in the Dashboard Designer, click the Parameters (

button in the dashboard title. Depending on the visibility state of the created dashboard parameters, this invokes the following dialog.

#### **Data Analysis**

Dashboard Parameters		×
Parameter	Value	
From date	1/1/2015	-
To date	1/1/2016	
Reset	Submit	Cancel

Select the required parameter values in the Dashboard Parameters dialog and click the **Submit** button to apply the changes.

To reset the changes to the default values, click the **Reset** button.

# **Printing and Exporting**

The Dashboard Designer provides the capability to print or export an entire dashboard and individual items.

## **Printing and Exporting Dashboards**

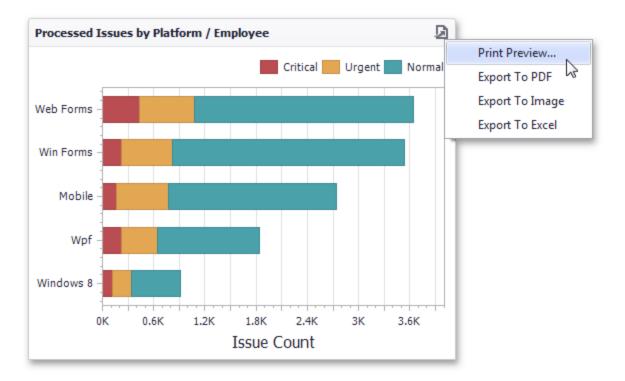

To print or export the entire dashboard, click the D button in the dashboard title area and choose the required action.

#### **Print Preview...**

Allows you to customize the document before printing/exporting. For instance, the following settings can be changed: the orientation and size of the printed page, page margins, etc.

## **Printing and Exporting Dashboard Items**

To print or export a dashboard item, click the  $\square$  button in its caption and choose the required action.

Print Preview...: Allows you to customize the document before printing/exporting.

**Export to PDF**: Invokes a corresponding dialog that allows you to export a dashboard to a PDF file with specific options.

**Export to Image**: Invokes a corresponding dialog that allows you to export a dashboard to image in the specified format.

**Export to Excel**: Invokes a corresponding dialog that allows you to export a dashboard item's data to the Excel workbook or CSV file.

## **Print Preview**

This document describes the Print Preview window, which displays the dashboard/dashboard item as it will appear on paper.

### **Specific Options**

In the Print Preview, you can change the orientation and size of the printed page, specify the margins, scale the document, etc. You can also customize printing options specific to a dashboard/dashboard item. To do this, click the **Options** button in the Print group. When previewing the dashboard, the following Options dialog will be invoked:

Options	x
Show Title:	$\checkmark$
Title:	Sales Overview
Include:	Filters
	Parameters
Position:	Below
Reset	Submit Cancel

**Show Title**: Specifies whether or not to show the dashboard title/dashboard item caption as the printed document title.

Title: Specifies the title of the printed document.

Include | Filters: Allows you to include master filter values to the printed document.

Include | Parameters: Allows you to include parameter values to the printed document.

**Position**: Specifies the position of the master filter and parameter values in the printed document. You can select between Below and Separate Page.

This dialog can contain different options, depending on the dashboard item.

## **Export Data**

You can export data to different formats.

1. 1. Click **Print Preview** to review the data that you will export.

UD3	Target	Act vs Target	Amount
Arizona	24.7M	1.3M	\$261
California	38.6M	2.03M	\$40.71
Connecticut	80.9M	4.26M	\$85.21
Florida	144M	7.58M	\$152

### **Export to PDF**

Invokes a corresponding dialog that allows you to export a dashboard to a PDF file with specific options. The following options are available.

Export To PDF - Sales Overview				
Page Layout:	O Portrait O Landscape O Auto			
Size:	Letter 🔹			
Show Title:	$\checkmark$			
Title:	Sales Overview			
Scale Mode:	None 🔻			
Scale Factor:	1 📩			
Auto Fit Page Count:	1 🌲			
Include:	<ul> <li>Filters</li> <li>Parameters</li> </ul>			
Position:	Below			
Reset	Export Cancel			

**Page Layout**: Specifies the page orientation used to export a dashboard. You can select between Portrait, Landscape, and Auto. Note that in the Auto mode, page orientation is selected automatically depending on the horizontal and vertical sizes of a dashboard.

Size: Specifies the standard paper size (for instance, Letter or A4).

Show Title: Specifies whether or not to apply the dashboard title to the exported document title.

Title: Specifies the title of the exported document.

**Scale Mode**: Specifies the mode for scaling when exporting a dashboard. This option is in effect when **Page Layout** is set to a value different from Auto.

**Scale Factor**: Specifies the scale factor (in fractions of 1) by which a dashboard is scaled. This option is in effect if Scale Mode is set to **Use Scale Factor**.

Auto Fit Page Count: Specifies the number of horizontal/vertical pages spanning the total width/height of a dashboard. This option is in effect if Scale Mode is set to Auto Fit to Page Width.

Include | Filters: Allows you to include master filter values to the exported document.

Include | Parameters: Allows you to include parameter values to the exported document.

**Position**: Specifies the position of the master filter and parameter values in the exported document. You can select between Below and Separate Page.

#### **Export to Image**

Invokes a corresponding dialog that allows you to export a dashboard to an image in the specified format. The following options are available.

Export To Image - Sales Overview				
Image Format:	PNG 🔻			
Show Title:	$\checkmark$			
Title:	Sales Overview			
Resolution (dpi):	96 🜲			
Indude:	<ul> <li>Filters</li> <li>Parameters</li> </ul>			
Reset	Export Cancel			

**Image Format**: Specifies the image format in which the dashboard is exported. The following formats are available: PNG, JPEG, and GIF.

**Show Title**: Specifies whether or not to apply the dashboard title to the exported document title.

Title: Specifies the title of the exported document.

Resolution (dpi): Specifies the resolution (in dpi) used to export a dashboard.

Include | Filters: Allows you to include master filter values to the exported document.

Include | Parameters: Allows you to include parameter values to the exported document.

### **Export to Excel**

Invokes a corresponding dialog that allows you to export dashboard's data to the Excel file. The following options are available:

Export To Excel - Sales Overview					
Excel Format:	XLSX				
Include:	Filters				
	Parameters				
Position:	Below -				
Reset	Export Cancel				

**Excel Format**: Specifies the Excel workbook format in which the dashboard's data is exported. You can select between XL SX and XL S.

Include | Filters: Allows you to include master filter values to the exported document.

Include | Parameters: Allows you to include parameter values to the exported document.

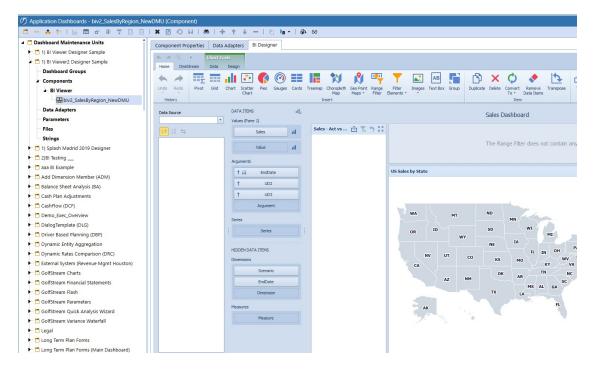

**Position**: Specifies the position of the master filter and parameter values in the exported document. You can select between Below and Separate Sheet.

Specify the required options in the invoked dialog and click the **Export** button to export the dashboard. To reset changes to the default values, click the **Reset** button.

## **Rename Table Connections**

This tab in the BI Designer is designed to Rename Table Connections in the event the Results Table Name from the Data Adapter changes names in the existing or new Dashboard Maintenance Unit. When a user changes the referenced results table name, the table connection can be reestablished by pointing the BI Designer to the correct table using this utility.

Existing BI Dashboard missing original table connection from data adapter. The dashboard items exist but without the supporting data.

BI Designer XF Tools menu to access the Rename Table Connections utility.

Component Properties	Data Adapters	BI Designer
